

Insertion Sort

<https://cs.pomona.edu/classes/cs140/>

Outline

Topics and Learning Objectives

- Specify an algorithm
- Prove correctness
- Analyze total running time

Exercise

- Friend Circles

Extra Materials

Cormen

- **Chapter 2** of Introduction to Algorithms, Third Edition
- <https://www.toptal.com/developers/sorting-algorithms/>

Survey (answer on Google Sheet)

- What do you go by (for example, I go by Tony instead of Anthony)?
- What data structures do you know (any amount of familiarity)?
- What algorithms do you know?
- What programming languages do you know?

Friend Circles Exercise

- Read the problem (about 1 minute)
 - Find the PDF on the course website
- Go to your break-out rooms (for about 5 minutes)
- Come back and discuss

Warm-Up

6 12 3 6 -15
↑ ↑

Sorting Problem

- **Input:** a sequence of numbers
- **Output:** a reordering of the input into nondecreasing order
- **Assumptions:** none

We will

- Specify the algorithm (**learn my pseudocode**),
- Argue that it correctly sorts, and
- Analyze its running time.

Specify the algorithm

Insertion Sort

1. **FUNCTION** InsertionSort(array)

2. **FOR** j **IN** [1 ..< array.length]

3. key = array[j] = 2

4. i = j - 1

5. **WHILE** i ≥ 0 && array[i] > key

6. array[i + 1] = array[i]

7. i = i - 1

8. array[i + 1] = key

9. **RETURN** array

// Insert "key" into correct
// position to its left.

Insertion Sort

1. **FUNCTION** InsertionSort(array)

2. **FOR** j **IN** [1 ..< array.length]

3. key = array[j]

4. i = j - 1

5. **WHILE** i ≥ 0 && array[i] > key

6. array[i + 1] = array[i]

7. i = i - 1

8. array[i + 1] = key

9. **RETURN** array

// Insert "key" into correct
// position to its left.

Already
sorted

Argue that it correctly sorts

Proof of correctness

Insertion Sort – Proof of correctness

Lemma (**loop invariant**)

- At the start of the iteration with index j , the subarray `array[0 .. j-1]` consists of the elements originally in `array[0 .. j-1]`, but in non-decreasing order.

What is a lemma?

an intermediate theorem in a proof

What is a theorem?

a proposition that can be proved by a chain of reasoning

```
1. FUNCTION InsertionSort(array)
2.   FOR j IN [1 ..< array.length]
3.     key = array[j]
4.     i = j - 1
5.     WHILE i ≥ 0 && array[i] > key
6.       array[i + 1] = array[i]
7.       i = i - 1
8.     array[i + 1] = key
9.   RETURN array
```

Insertion Sort – Proof of correctness

Lemma (**loop invariant**)

- At the start of the iteration with index j , the subarray `array[0 ..= j-1]` consists of the elements originally in `array[0 ..= j-1]`, but in non-decreasing order.

True
↓

General conditions for **loop invariants**

↓

- Initialization:** The loop invariant is satisfied at the beginning of the loop.
- Maintenance:** If the loop invariant is true before the i th iteration, then the loop invariant will be true before the $i+1$ iteration.
- Termination:** When the loop terminates, the invariant gives us a useful property that helps show that the algorithm is correct.

```
1. FUNCTION InsertionSort(array)
2.   FOR j IN [1 ..< array.length]
3.     key = array[j]
4.     i = j - 1
5.     WHILE i ≥ 0 && array[i] > key
6.       array[i + 1] = array[i]
7.       i = i - 1
8.     array[i + 1] = key
9.   RETURN array
```

Insertion Sort – Proof of correctness

1. Initialization: The loop invariant is satisfied at the beginning of the loop.

$\text{array}[0 \dots j-1]$
1-1
0

$\text{array}[0 \dots 0]$

Lemma (loop invariant)

- At the start of the iteration with index j , the subarray $\text{array}[0 \dots j-1]$ consists of the elements originally in $\text{array}[0 \dots j-1]$, but in non-decreasing order.

```
1. FUNCTION InsertionSort(array)
2.   FOR j IN [1]..< array.length
3.     key = array[j]
4.     i = j - 1
5.     WHILE i ≥ 0 && array[i] > key
6.       array[i + 1] = array[i]
7.       i = i - 1
8.     array[i + 1] = key
9.   RETURN array
```

For to While Loop

Insertion Sort – Proof of correctness

1. Initialization: The loop invariant is satisfied at the beginning of the loop.

Lemma (loop invariant)

- At the start of the iteration with index j , the subarray `array[0 ..= j-1]` consists of the elements originally in `array[0 ..= j-1]`, but in non-decreasing order.
- When $j = 1$, the subarray is `array[0 ..= 1-1]`, which includes only the first element of the `array`. The single element subarray is sorted.

```
1. FUNCTION InsertionSort(array)
2.   FOR j IN [1 ..< array.length]
3.     key = array[j]
4.     i = j - 1
5.     WHILE i ≥ 0 && array[i] > key
6.       array[i + 1] = array[i]
7.       i = i - 1
8.     array[i + 1] = key
9.   RETURN array
```

Insertion Sort – Proof of correctness

2. **Maintenance:** If the loop invariant is true before the i th iteration, then the loop invariant will be true before the $i+1$ iteration.

Lemma (loop invariant)

- At the start of the iteration with index j , the subarray `array[0 ..= j-1]` consists of the elements originally in `array[0 ..= j-1]`, but in non-decreasing order.
- Assume `array[0 ..= j-1]` is sorted. Informally, the loop operates by moving elements to the right until it finds the position of key. Next, j is incremented.

```
1. FUNCTION InsertionSort(array)
2.   FOR j IN [1 ..< array.length]
3.     key = array[j]
4.     i = j - 1
5.     WHILE i ≥ 0 && array[i] > key
6.       array[i + 1] = array[i]
7.       i = i - 1
8.     array[i + 1] = key
9.   RETURN array
```

Insertion Sort – Proof of correctness

3. **Termination:** When the loop terminates, the invariant gives us a useful property that helps show that the algorithm is correct.

Lemma (loop invariant)

- At the start of the iteration with index j , the subarray $\text{array}[0 \dots j-1]$ consists of the elements originally in $\text{array}[0 \dots j-1]$, but in non-decreasing order.
- The loop terminates when $j = n$. Given the initialization and maintenance results, we have shown that: $\text{array}[0 \dots j-1] \rightarrow \text{array}[0 \dots n-1]$ in non-decreasing order.

```
1. FUNCTION InsertionSort(array)
2.   FOR j IN [1 ..< array.length]
3.     key = array[j]
4.     i = j - 1
5.     WHILE i ≥ 0 && array[i] > key
6.       array[i + 1] = array[i]
7.       i = i - 1
8.     array[i + 1] = key
9.   RETURN array
```

Analyze its running time

Proof of running time

Insertion Sort – Running time

Analyze using the **RAM** (random access machine) model

- Instructions are executed one after another (no parallelism)
- Each instruction takes a constant amount of time
 - Arithmetic (+, -, *, /, %, floor, ceiling)
 - Data movement (load, store, copy)
 - Control (branching, subroutine calls)
- **Ignores memory hierarchy!** (never forget: linked lists are awful)
- This is a very simplified way of looking at algorithms
- Compare algorithms while ignoring hardware

Insertion Sort – Running time

On what does the running time depend?

- Number of items to sort
 - 3 numbers vs 1000

```
1. FUNCTION InsertionSort(array)
2.   FOR j IN [1 ..< array.length]
3.     key = array[j]
4.     i = j - 1
5.     WHILE i ≥ 0 && array[i] > key
6.       array[i + 1] = array[i]
7.       i = i - 1
8.     array[i + 1] = key
9.   RETURN array
```

Insertion Sort – Running time

On what does the running time depend?

- Number of items to sort
 - 3 numbers vs 1000
- How much are they already sorted
 - The hint here is that the inner loop is a **while** loop (not a for loop)

```
1. FUNCTION InsertionSort(array)
2.   FOR j IN [1 ..< array.length]
3.     key = array[j]
4.     i = j - 1
5.     WHILE i ≥ 0 && array[i] > key
6.       array[i + 1] = array[i]
7.       i = i - 1
8.     array[i + 1] = key
9.   RETURN array
```

```
1. FUNCTION InsertionSort(array)
2.   FOR j IN [1 ..< array.length]
3.     key = array[j]
4.     i = j - 1
5.     WHILE i ≥ 0 && array[i] > key
6.       array[i + 1] = array[i]
7.       i = i - 1
8.     array[i + 1] = key
9.   RETURN array
```

Cost

```
1.   0
2.   ?
```

```
1. FUNCTION InsertionSort(array)
2.   j = 1
3.   WHILE j < array.length
4.     key = array[j]
5.     i = j - 1
6.     WHILE i ≥ 0 && array[i] > key
7.       array[i + 1] = array[i]
8.       i = i - 1
9.     array[i + 1] = key
10.  j = j + 1
11.  RETURN array

3.	2	n
4.	2	n - 1
5.	2	n - 1
6.	4	(n - 1)x
7.	4	(n - 1)(x - 1)
8.	2	(n - 1)(x - 1)
9.	3	n - 1
10.	2	n - 1
11.	1	1

Loop code always executes one fewer time than the condition check.

Depends on how sorted **array** is

```

1. FUNCTION InsertionSort(array)
2.   j = 1
3.   WHILE j < array.length
4.     key = array[j]
5.     i = j - 1
6.     WHILE i ≥ 0 && array[i] > key
7.       array[i + 1] = array[i]
8.       i = i - 1
9.     array[i + 1] = key
10.    j = j + 1
11.  RETURN array

```

	<u>Cost</u>	<u>Executions</u>
1.	0	0
2. +	1	1
3. +	2	n
4. +	2	n - 1
5. +	2	n - 1
6.	4	(n - 1)x
7.	4	(n - 1)(x - 1)
8.	2	(n - 1)(x - 1)
9.	3	n - 1
10.	2	n - 1
11.	1	1

Loop code always executes one fewer time than the condition check.

Depends on how sorted **array** is

What is the **total running time** (add up all operations)?

```

1. FUNCTION InsertionSort(array)
2.   j = 1
3.   WHILE j < array.length
4.     key = array[j]
5.     i = j - 1
6.     WHILE i ≥ 0 && array[i] > key
7.       array[i + 1] = array[i]
8.       i = i - 1
9.     array[i + 1] = key
10.    j = j + 1
11.  RETURN array

```

	<u>Cost</u>	<u>Executions</u>
1.	0	0
2.	1	1
3.	2	n
4.	2	n - 1
5.	2	n - 1
6.	4	(n - 1)x
7.	4	(n - 1)(x - 1)
8.	2	(n - 1)(x - 1)
9.	3	n - 1
10.	2	n - 1
11.	1	1

Loop code always executes one fewer time than the condition check.

Depends on how sorted **array** is

What is the **total running time** (add up all operations)?

$$\begin{aligned}
 \text{Total Running Time} &= 1 + 2n + (n - 1)(2 + 2 + 4x + (x - 1)(4 + 2) + 3 + 2) + 1 \\
 &= 10nx + 5n - 10x - 1
 \end{aligned}$$

```

1. FUNCTION InsertionSort(array)
2.   j = 1
3.   WHILE j < array.length
4.     key = array[j]
5.     i = j - 1
6.     WHILE i ≥ 0 && array[i] > key
7.       array[i + 1] = array[i]
8.       i = i - 1
9.       array[i + 1] = key
10.    j = j + 1
11.   RETURN array

```

	<u>Cost</u>	<u>Executions</u>
1.	0	0
2.	1	1
3.	2	n
4.	2	n - 1
5.	2	n - 1
6.	4	(n - 1)x
7.	4	(n - 1)(x - 1)
8.	2	(n - 1)(x - 1)
9.	3	n - 1
10.	2	n - 1
11.	1	1

Loop code always executes one fewer time than the condition check.

Depends on how sorted **array** is

What is the **best-case** scenario?

array is already sorted

x = ?

$$\begin{aligned}
 \text{Total Running Time} &= 1 + 2n + (n - 1)(2 + 2 + 4x + (x - 1)(4 + 2) + 3 + 2) + 1 \\
 &= 10nx + 5n - 10x - 1 \quad x = 1 \\
 &= 10n + 5n - 10 - 1 \\
 &= 15n - 11
 \end{aligned}$$

Is "- 11" a problem? Negative time?

```

1. FUNCTION InsertionSort(array)
2.   j = 1
3.   WHILE j < array.length
4.     key = array[j]
5.     i = j - 1
6.     WHILE i ≥ 0 && array[i] > key
7.       array[i + 1] = array[i]
8.       i = i - 1
9.     array[i + 1] = key
10.    j = j + 1
11.  RETURN array

```

	<u>Cost</u>	<u>Executions</u>
1.	0	0
2.	1	1
3.	2	n
4.	2	n - 1
5.	2	n - 1
6.	4	(n - 1)x
7.	4	(n - 1)(x - 1)
8.	2	(n - 1)(x - 1)
9.	3	n - 1
10.	2	n - 1
11.	1	1

Loop code always executes one fewer time than the condition check.

Depends on how sorted **array** is

$1 + 2 + 3 + \dots + n$

What is the **worst-case** scenario?

array is reverse sorted

x = ?

$$\begin{aligned}
 \text{Total Running Time} &= 1 + 2n + (n - 1)(2 + 2 + 4x + (x - 1)(4 + 2) + 3 + 2) + 1 \\
 &= 10nx + 5n - 10x - 1 \quad \text{x = n/2 on average} \\
 &= 5n^2 + 5n - 5n - 1 \\
 &= 5n^2 - 1
 \end{aligned}$$

Best, Worst, and Average

We usually concentrate on worst-case

- Gives an upper bound on the running time for any input
- The worst case can occur fairly often ✓
- The average case is often relatively as bad as the worst case

$$O(n^2)$$

Summary
