In-Class Worksheet

Discrete Math & Functional Programming— CSCI 054— Spring 2025 Instructor: Osborn

What are the types of these functions?

```
equal :: (Eq a) => [a] -> [a] -> Bool
equal [] [] = True
equal _ [] = False
equal [] _ = False
equal (x:xs) (y:ys) =
   if x == y
   then equal xs ys
   else False
```

Use pattern matching to write a function every0ther that takes a list and returns a new list consisting of every other element in the original list starting with the first element. As an example, every0ther [1,5,2,4,-1] should return [1,2,-1].

What does the following function do? What are examples of function calls that would evaluate to each of "group 1", "group 2", "group 3", and "group 4"?

import Data.Char
