# Transmitting information - cryptography

---

- ▶ goal is to keep someone with access to the channel from finding out information about the message.
- ▶ assumptions (for now)
  - ▶ message = message'
  - ▶ codeword = codeword'
- ▶ why?
- ▶ how?

# Private key cryptography

---

- ▶ Symmetric-key algorithms
- ▶ The communicating parties share a piece of secret information (the key  $k$ )

# Public key cryptography

- ▶ asymmetric-key algorithm
- ▶ Everyone who wants to receive messages generates a public/private key pair and publishes their public key.
- ▶ To send a message to someone, you encrypt it with their public key.
- ▶ When you receive a message you decrypt it with your private key.

PGP Global Directory  
Verified Key Service

Home Help

**Search For Keys**

Search

Enter a name, email address, or key ID [advanced](#)

The PGP Global Directory is a free service designed to make it easier to find and trust the universe of PGP keys. Publish your key today and allow others to start sending you secure email.

**Publish Your Key**  
Upload your PGP public key to make it searchable by the PGP community.

**Remove Your Key**  
Remove your key from the searchable directory.

# RSA algorithm

---

- ▶ A very widely used public key encryption algorithm
- ▶ Three algorithmic components
  - ▶ key generation
  - ▶ encryption
  - ▶ decryption
- ▶ Our plan
  - ▶ What is the algorithm?
  - ▶ Why does it work?
  - ▶ How to implement it efficiently?

---

---

# Greatest common divisor (gcd)

---

- ▶  $\text{gcd}(a,b)$  is the largest positive integer that divides both  $a$  and  $b$  without a remainder.
- ▶ Practice:
  - ▶  $\text{gcd}(14, 63)$
  - ▶  $\text{gcd}(23, 5)$
  - ▶  $\text{gcd}(100, 9)$
- ▶ if  $\text{gcd}(a,b) = 1$  then:
  - ▶  $a$  and  $b$  have no factors in common
  - ▶ we say that  $a$  and  $b$  are relatively prime
  - ▶ there exists an integer  $x$  such that  $ax = 1 \pmod{b}$

---

---

# RSA algorithm: key generation

---

1. Choose a bit-length  $k$
2. Choose two primes  $p$  and  $q$  which can be represented with  $k$  bits
3. Let  $n = pq$ . This means  $\phi(n) = (p-1)(q-1)$
4. Find  $e$  such that  $0 < e < n$  and  $\gcd(e, \phi(n)) = 1$
5. Find  $d$  such that  $(d * e) \bmod \phi(n) = 1$

# RSA encryption: example (part 1)

---

p: prime number

q: prime number

$n = pq$

$$\phi(n) = (p-1)(q-1)$$

$$e: 0 < e < n \text{ and } \gcd(e, \phi(n)) = 1$$

$$d: (d * e) \bmod \phi(n) = 1$$

---

$$p = 3$$

$$q = 13$$

$$n =$$

$$\phi(n) =$$

$$e =$$

$$d =$$

---

# RSA algorithm: encryption, decryption

---

- ▶ You now have your
  - ▶ public key:  $(e,n)$
  - ▶ private key:  $(d,n)$
- ▶ If someone wants to send you a message (number)  $m$ , they:
- ▶ compute and send:  $\text{encrypt}(m) = m^e \bmod n$
- ▶ When you get a message  $z$ , you:
- ▶ compute and read:  $\text{decrypt}(z) = z^d \bmod n$

**Figure 7.27** A schematic of the RSA cryptosystem, where  $n = pq$  and  $de \equiv_{(p-1)(q-1)} 1$ , for prime numbers  $p$  and  $q$ .

## RSA encryption: example (part 2)

---

p: prime number  
q: prime number  
n = pq

$$\phi(n) = (p-1)(q-1)$$

$$e: 0 < e < n \text{ and } \gcd(e, \phi(n)) = 1$$

$$d: (d \cdot e) \bmod \phi(n) = 1$$

---

$$p = 3$$

$$q = 13$$

$$n = 39$$

$$\phi(n) = 24$$

$$e = 5$$

$$d = 29$$

What is the public key?

What is the private key?

What do you get if you encrypt 10?

# RSA encryption: an example

---

p: prime number  
q: prime number  
n = pq

$$\phi(n) = (p-1)(q-1)$$

$$e: 0 < e < n \text{ and } \gcd(e, \phi(n)) = 1$$

$$d: (d \cdot e) \bmod \phi(n) = 1$$

---

$$p = 3$$

$$q = 13$$

$$n = 39$$

$$\phi(n) = 24$$

$$e = 5$$

$$d = 29$$

What is the public key?

(5, 39)

What is the private key?

(29, 39)

What do you get if you encrypt 10?

$$10^5 \bmod 39 = 4$$

# Why does the RSA algorithm work?

**Figure 7.27** A schematic of the RSA cryptosystem, where  $n = pq$  and  $de \equiv_{(p-1)(q-1)} 1$ , for prime numbers  $p$  and  $q$ .

---

---

# RSA: correctness

---

- ▶ Claim:  $\text{decrypt}(\text{encrypt}(m)) = m$
- ▶ Proof:  
     $\text{decrypt}(\text{encrypt}(m)) = \dots$

p: prime number  
q: prime number  
 $n = pq$

$\phi(n) = (p-1)(q-1)$   
e:  $\text{gcd}(e, \phi(n)) = 1$   
d:  $(d * e) \bmod \phi(n) = 1$

$\text{encrypt}(m) = m^e \bmod n$   
 $\text{decrypt}(z) = z^d \bmod n$

# RSA: correctness

---

▶ Claim:  $\text{decrypt}(\text{encrypt}(m)) = m$

▶ Proof:

$$\begin{aligned}\text{decrypt}(\text{encrypt}(m)) &= \text{decrypt}(m^e \bmod n) \\ &= (m^e \bmod n)^d \bmod n \\ &= (m^e)^d \bmod n \\ &= (m^{ed}) \bmod n \\ &= (m^{k\phi(n)+1}) \bmod n \\ &= (mm^{k\phi(n)}) \bmod n \\ &= (m \bmod n) * (m^{k\phi(n)} \bmod n) \\ &\quad \dots \text{now what?}\end{aligned}$$

p: prime number  
q: prime number  
 $n = pq$

$\phi(n) = (p-1)(q-1)$   
e:  $\text{gcd}(e, \phi(n)) = 1$   
d:  $(d * e) \bmod \phi(n) = 1$

$\text{encrypt}(m) = m^e \bmod n$   
 $\text{decrypt}(z) = z^d \bmod n$

# Fermat and Euler

---

- ▶ **Fermat's Little Theorem:**

- ▶ If  $p$  is prime and  $\gcd(a,p) = 1$ , then  $a^{p-1} = 1 \pmod p$
- ▶ Equivalently,  $a^p = a \pmod p$

- ▶ **Euler:**

- ▶ Euler's totient function:  $\phi(n) = | \{ x : x < n \text{ and } \gcd(n,x) = 1 \} |$ 
  - ▶ What is  $\phi(n)$  if  $n$  is prime?
- ▶ Theorem: If  $\gcd(a,n) = 1$ , then  $a^{\phi(n)} = 1 \pmod n$

# RSA: correctness

---

▶ Claim:  $\text{decrypt}(\text{encrypt}(m)) = m$

▶ Proof:

$$\begin{aligned}\text{decrypt}(\text{encrypt}(m)) &= \text{decrypt}(m^e \bmod n) \\ &= (m^e \bmod n)^d \bmod n \\ &= (m^e)^d \bmod n \\ &= (m^{ed}) \bmod n \\ &= (m^{k\phi(n)+1}) \bmod n \\ &= (mm^{k\phi(n)}) \bmod n \\ &= (m \bmod n) * (m^{k\phi(n)} \bmod n)\end{aligned}$$

p: prime number  
q: prime number  
 $n = pq$

$\phi(n) = (p-1)(q-1)$   
e:  $\text{gcd}(e, \phi(n)) = 1$   
d:  $(d * e) \bmod \phi(n) = 1$

$\text{encrypt}(m) = m^e \bmod n$   
 $\text{decrypt}(z) = z^d \bmod n$

Euler: If  $\text{gcd}(a, n) = 1$ , then  $a^{\phi(n)} = 1 \bmod n$

# RSA: correctness

▶ Claim:  $\text{decrypt}(\text{encrypt}(m)) = m$

▶ Proof:

$$\text{decrypt}(\text{encrypt}(m)) = \text{decrypt}(m^e \bmod n)$$

$$= (m^e \bmod n)^d \bmod n$$

$$= (m^e)^d \bmod n$$

$$= (m^{ed}) \bmod n$$

$$= (m^{k\phi(n)+1}) \bmod n$$

$$= (mm^{k\phi(n)}) \bmod n$$

$$= (m \bmod n) * (m^{k\phi(n)} \bmod n)$$

$$= (m \bmod n) * ((m^{\phi(n)})^k \bmod n)$$

$$= (m \bmod n), \text{ as long as } \gcd(m, n) = 1$$

$$= m, \text{ as long as } m < n$$

p: prime number  
q: prime number  
 $n = pq$

$\phi(n) = (p-1)(q-1)$

$\text{encrypt}(m) = m^e \bmod n$   
 $\text{decrypt}(z) = z^d \bmod n$

Euler: If  $\gcd(a, n) = 1$ , then  
 $a^{\phi(n)} = 1 \bmod n$

# RSA in practice

---

- ▶ What if the message isn't a number?
  - ▶ Everything is a number
- ▶ What if the message isn't a number less than  $n$ ?
  - ▶ Divide it into chunks
- ▶ Would you ever flip? Encrypt with private key and decrypt with public key?
  - ▶ Digital signature

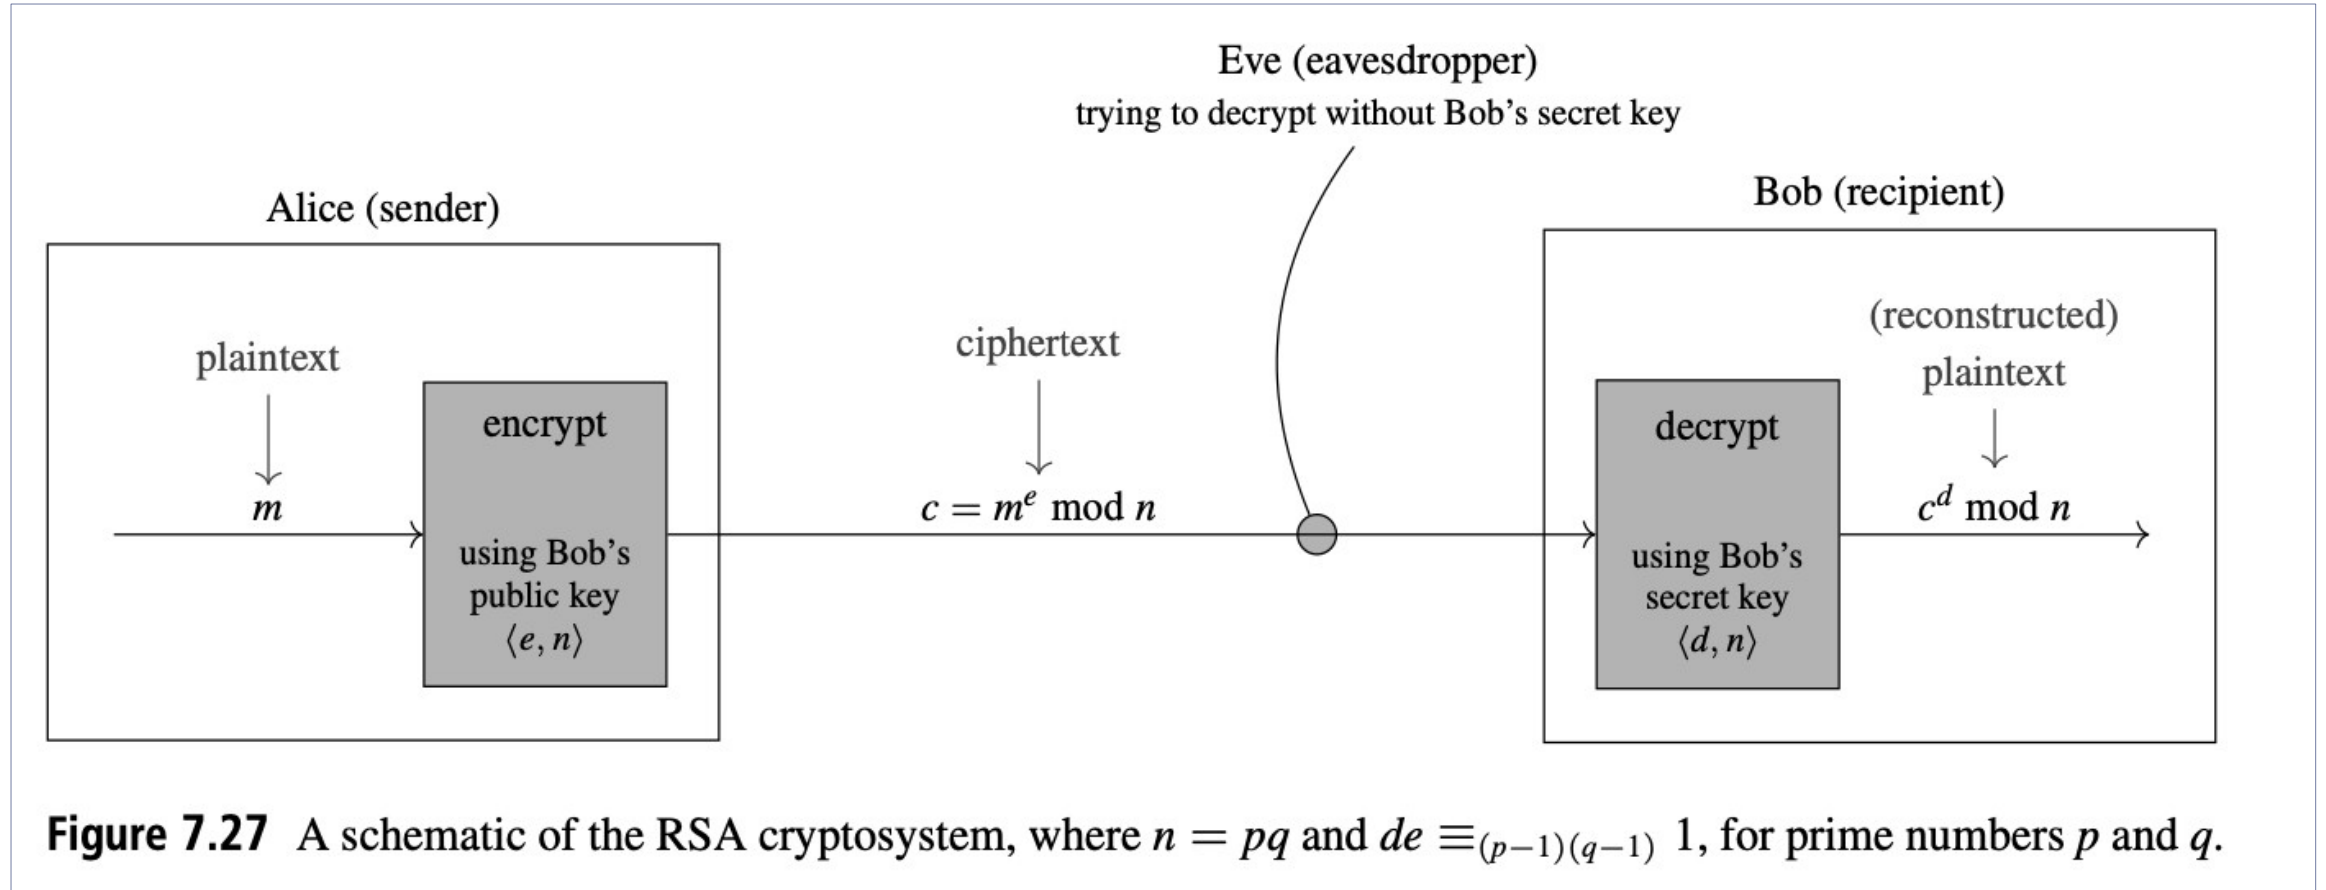

---

---

# Why is RSA algorithm good?

How secure is this?

# Security of RSA

---

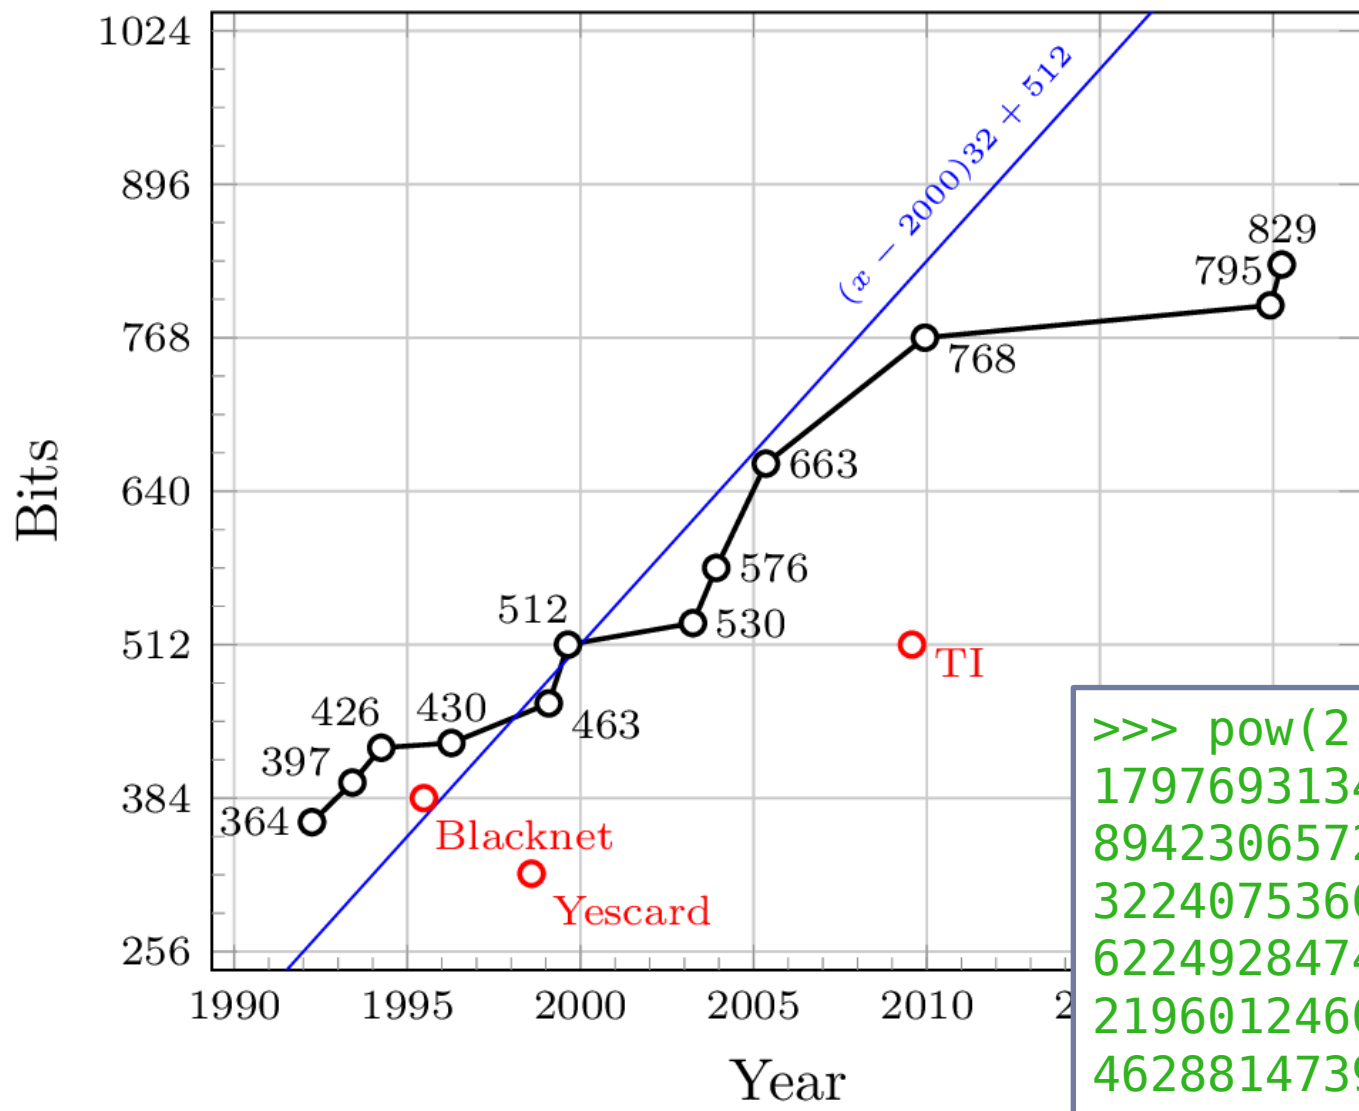

- ▶ Given  $\text{encrypt}(m)$ , can you figure out  $m$ ?
  - ▶ given  $m^e \bmod n$  can you figure out  $m$ ?
  - ▶ issue is that many, many messages  $m$  will map to the same encrypted value.
- ▶ Given  $(e, n)$ , can you figure out  $(d, n)$ ?
  - ▶ know:  $(d * e) \bmod \phi(n) = 1$
  - ▶ but you don't know  $\phi(n)$  and there isn't a good way to get it unless you can figure out  $p$  and  $q$  from  $n$
  - ▶ how expensive is this?

$p$ : prime number  
 $q$ : prime number  
 $n = pq$

$\phi(n) = (p-1)(q-1)$   
 $e$ :  $\gcd(e, \phi(n)) = 1$   
 $d$ :  $(d * e) \bmod \phi(n) = 1$

$\text{encrypt}(m) = m^e \bmod n$   
 $\text{decrypt}(z) = z^d \bmod n$
