

Lecture 22: Audit

CS 138

Spring 2026

Classes of Countermeasures

- **Authentication:** mechanisms that bind principals to actions
- **Authorization:** mechanisms that govern whether actions are permitted
- **Audit:** mechanisms that record and review actions

Uses of audit

- **Deterrence through accountability:** deter misbehavior

The image displays three IRS tax forms. The first is Form 1040, U.S. Individual Income Tax Return for 2017, showing a taxpayer with a Social Security Number of 22222 and an employer, 'The Big Company'. The second is Form 1041-SS, Resident Income Tax Return for 2017, for a taxpayer with a Social Security Number of 55-5765489. The third is Form 1515, Miscellaneous Income Form 1099-MISC for 2017, showing various income categories and amounts.

- **Detection and recovery:** determine what happened and how to recover

The screenshot shows the IRS Direct Pay website with a red banner indicating a 'Planned Outage: April 17, 2018 - December 31, 9999'. Below the banner, a message states: 'This service is unavailable from approximately 2:50 A.M. ET, on Tuesday April 17, 2018 until approximately 6:40 P.M. ET, on Thursday September 22, 2016, due to planned maintenance. Please come back after that time, or you can visit [Make a Payment](#) for alternative payment methods. We apologize for any inconvenience. Note that your tax payment is due although IRS Direct Pay may not be available.'

Data Center ► Servers

It's US Tax Day, so of course the IRS's servers have taken a swan dive

59% of our systems are obsolete, agency boss tells congressional hearing

I.R.S. Website Crashes on Tax Day as Millions Tried to File Returns

By ALAN RAPPEPORT APRIL 17, 2018

- **Problem monitoring:** real-time intelligence

Audit tasks

- **Recording:**
 - what to log
 - what not to log
 - how to log
 - locally
 - remotely
 - how to protect the log
- **Reviewing:**
 - automated analysis
 - manual exploration

WHAT TO LOG

What to log?

Example: US State Department pilot program (1980s)

- Requirements:
 - log every transaction related to protected electronic documents
 - system administrator reviews log daily to search for malicious behavior
- Experiment:
 - test system for 5 users, 10 minutes
 - audit log was a stack of paper
 - real system would have been 1000s of users working 24/7
- Lessons learned:
 - logging and review of everything by a human is impractical
 - need to reduce information logged: **log reduction**
 - need automated review

States vs. events

- **States:** data, *what the system is*
 - backup, or more
 - survive power failures, crashes, attacks
 - **what state?** memory, disk, network, ...
 - consistent snapshot of distributed system is hard
- **Events:** actions, *how the system came to be*
 - login, access to protected resource, elevation and attenuation of privileges, ...
 - our focus
 - **which events?**

Recall: Security requirements

- **Functional requirement:** something system should do
 - e.g., allow people to cash checks
- **Security goal:** something system should/shouldn't do
 - e.g., prevent loss of revenue through bad checks
- **Security requirement:** constraint on functional requirement to achieve goal
 - e.g., check must be drawn on bank where being cashed, or person cashing must be customer at that bank and deposit in their account

Events to log

- **Any event that involves a security requirement**
 - Fact that requirement was checked
 - Whether it was met or not
 - The information that led to that decision
- Typically involves the gold standard...
 - whether a **principal was authenticated**, or
 - whether an **action was authorized**

Orange Book logging

For minimal C2 level certification:

- **Events** to log:
 - Use of identification and **authentication** mechanisms
 - **Introduction of objects** into a user's address space (e.g., file open, program initiation)
 - **Deletion of objects**
 - Actions taken by computer **operators** and system **administrators** and/or system **security officers**

Orange Book logging

For minimal C2 level certification:

- **What** to log:
 - Date and time of the event
 - User
 - Type of event
 - Success or failure of the event
 - For identification/authentication events: origin of request
 - For events involving objects: name of the object

What not to log

- Some information might be too sensitive for log files:
 - cryptographic keys, passwords
 - the details of company's shiny new product
 - the GPS coordinates of undercover secret agents

macOS High Sierra Logs Encryption Passwords in Plaintext for APFS External Drives

By [Catalin Cimpanu](#)

 March 27, 2018  04:45 PM  0

- Possibilities:
 - log it anyway, protect the log
 - [sanitize](#) log

Sanitization

Protect confidential information in log

- by **deleting**
- by **modifying**
 - e.g., replace with user names with pseudonyms, keep separate protected map between names and pseudonyms

Sanitization

- **Before** writing to log:
 - **Pro:** protects users from system administrators; maybe surveillance warranted only with probable cause
 - **Con:** have to decide in advance, as part of system design, what information to keep vs. discard
- **After** writing to log:
 - **Con:** confidentiality of log must be (more) protected
 - **Pro:** can decide afterwards what information to discard, perhaps even redact logs and send to 3rd party for analysis

Exercise

- Imagine that you are designing the log for a system. What events would you log? What information would you include for each log entry?
- Possible systems:
 - Gradescope
 - Instagram
 - the 5C SSO
 - a banking app/site

HOW TO LOG

Say what you mean

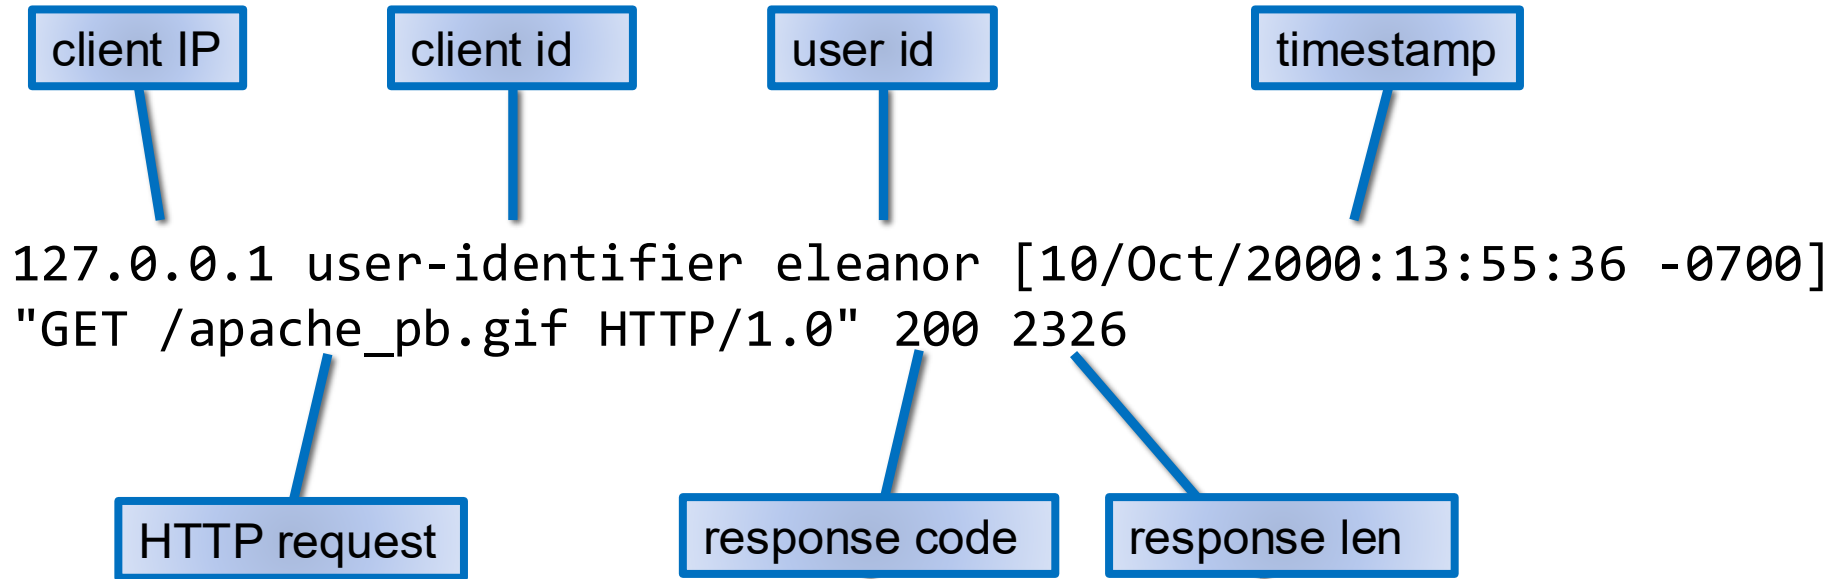

Main principle: Every log entry should say what it means

- Interpretation of log entry should depend only upon content of log entry
- Hence reviewer can recover meaning without needing to assume or supply any context

Log file format

- Keeping log files in standard format enables...
 - Reuse of tools for log analysis
 - Correlation across logs from multiple applications
- Standard formats:
 - Common Log Format (used by web servers)
 - syslog (used by Unix)
 - originated with sendmail
 - became a *de facto* standard
 - then standardized by IETF: [RFC 5424](#)
 - examples: take a look in your local /var/log directory

Common Log Format

syslog example message

timestamp

hostname

application

process id

Apr 8 00:48:29 ariel kernel[0]:
AppleThunderboltNHIType2::prePCIWake - power up
complete - took 1624 us

message

Log space

What happens if log size grows too large?

- **Halt** system
- **Overwrite** previous entries
- **Stop** logging

REVIEWING THE LOG

Manual review

- Enable administrators to explore logs and look for {states, events}
- **Issues:**
 - Designers might not have anticipated the right {states, events} to record
 - Visualization, query, expressivity (HCI/DB issues)
 - Correlation amongst multiple logs

Interfaces

- **Flat text**
- **Hypertext**
- **DBMS**
- **Visualization tools**

Techniques

- **Temporal replay:** animate what happened when
- **Slice:** display minimal set of log events that affect a given object

Automated review and response

- **Review:** detect suspicious behavior that looks like an attack, or detect violations of explicit policy
 - Custom-built systems
 - Classic AI techniques like training neural nets, expert systems, etc.
 - Modern applications of machine learning
- **Response:** report, take action

Exercise

- Imagine that you have designing the log for a system. How should this log be used? What tools/visualizations/guidelines would you provide to make the best use of this log?
- Possible systems:
 - Gradescope
 - Instagram
 - the 5C SSO
 - a banking app/site

Exercise

- Start designing an audit system for your project
 - what will you log?
 - how will you log it?
 - what will you do with it?

Audit
