Assignment 1

Assignment 2

2

Recurrence

A function that is defined with respect to itself on smaller inputs

$$T(n) = 2T(n/2) + n$$

$$T(n) = 16T(n/4) + n$$

$$T(n) = 2T(n-1) + n^2$$

3

The challenge

Recurrences are often easy to define because they mimic the structure of the program

But... they do not directly express the computational cost, i.e. n , n^2 , ...

We want to remove self-recurrence and find a more understandable form for the function

4

Three approaches

Substitution method: when you have a good guess of the solution, prove that it's correct

Recursion-tree method: If you don't have a good guess, the recursion tree can help. Then solve with substitution method.

Master method: Provides solutions for recurrences of the form:

$$T(n) = aT(n/b) + f(n)$$

5

Substitution method

Guess the form of the solution
Then prove it's correct by induction

$$T(n) = T(n/2) + d$$

Halves the input then constant amount of work

Similar to binary search:

Guess: $O(\log_2 n)$

6

$$T(n) = 2T(n/2) + n$$

Guess the solution?

Recurses into 2 sub-problems that are half the size and performs some operation on all the elements

$O(n \log n)$

What if we guess wrong, e.g. $O(n^2)$?

Assume $T(k) = O(k^2)$ for all $k < n$

- again, this implies that $T(n/2) \leq c(n/2)^2$

Show that $T(n) = O(n^2)$

7

$$T(n) = 2T(n/2) + n$$

$$\leq 2c(n/2)^2 + n \text{ from our inductive hypothesis}$$

$$= 2cn^2 / 4 + n$$

$$= 1/2cn^2 + n$$

$$= cn^2 - (1/2cn^2 - n) \text{ residual}$$

if

$$-(1/2cn^2 - n) \leq 0$$

$$-1/2cn^2 + n \leq 0$$

$$cn \geq 2$$

overkill?

8

$T(n) = 2T(n/2) + n$

What if we guess wrong, e.g. $O(n)$?

Assume $T(k) = O(k)$ for all $k < n$

- again, this implies that $T(n/2) \leq c(n/2)$

Show that $T(n) = O(n)$

$$\begin{aligned}
 T(n) &= 2T(n/2) + n \\
 &\leq 2cn/2 + n \\
 &= cn + n \\
 &\leq cn
 \end{aligned}$$

factor of n so we can just roll it in?

9

$T(n) = 2T(n/2) + n$

What if we guess wrong, e.g. $O(n)$?

Assume $T(k) = O(k)$ for all $k < n$

- again, this implies that $T(n/2) \leq c(n/2)$

Show that $T(n) = O(n)$

$$\begin{aligned}
 T(n) &= 2T(n/2) + n \\
 &\leq 2cn/2 + n \\
 &= cn + n \\
 &\leq cn
 \end{aligned}$$

Must prove the exact form!
 $cn + n \leq cn$??

factor of n so we can just roll it in?

10

$T(n) = 2T(n/2) + n$

Prove $T(n) = O(n \log_2 n)$

Assume $T(k) = O(k \log_2 k)$ for all $k < n$

- again, this implies that $T(k) = ck \log_2 k$

Show that $T(n) = O(n \log_2 n)$

$$\begin{aligned}
 T(n) &= 2T(n/2) + n \\
 &\leq 2cn/2 \log_2(n/2) + n \\
 &\leq cn(\log_2 n - \log_2 2) + n \\
 &\leq cn \log_2 n - \underbrace{cn + n}_{\text{residual}} \\
 &\leq cn \log_2 n
 \end{aligned}$$

if $cn \geq n, c > 1$

11

Recursion Tree

Guessing the answer can be difficult

$$\begin{aligned}
 T(n) &= 3T(n/4) + n^2 \\
 T(n) &= T(n/3) + 2T(2n/3) + cn
 \end{aligned}$$

The recursion tree approach

- Draw out the cost of the tree at each level of recursion
- Sum up the cost of the levels of the tree
- Find the cost of each level with respect to the depth
- Figure out the depth of the tree
- Figure out (or bound) the number of leaves
- Verify your answer using the substitution method

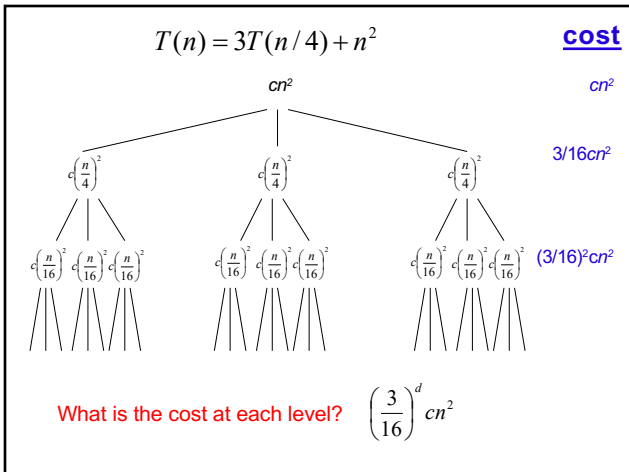

14

15

16

17

What is the depth of the tree?

At each level, the size of the data is divided by 4

$$\frac{n}{4^d} = 1$$

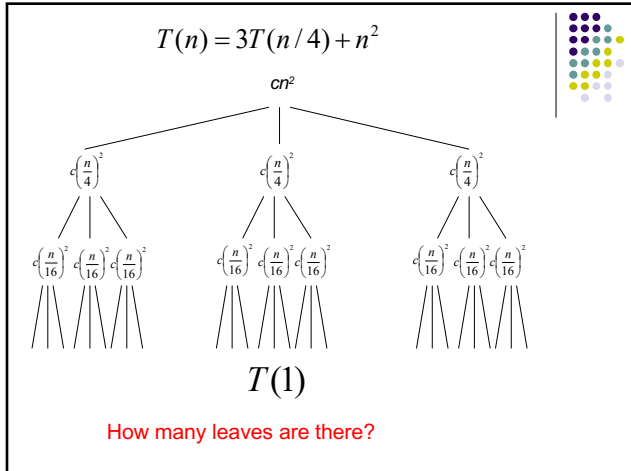

$$\log\left(\frac{n}{4^d}\right) = 0$$

$$\log n - \log 4^d = 0$$

$$d \log 4 = \log n$$

$$d = \log_4 n$$

18

19

How many leaves?

How many leaves are there in a complete ternary tree of depth d ?

$$3^d = 3^{\log_4 n}$$

20

Total cost

$$T(n) = cn^2 + \frac{3}{16}cn^2 + \left(\frac{3}{16}\right)^2 cn^2 + \dots + \left(\frac{3}{16}\right)^{d-1} cn^2 + \Theta(3^{\log_4 n})$$

$$= cn^2 \sum_{i=0}^{\log_4 n - 1} \left(\frac{3}{16}\right)^i + \Theta(3^{\log_4 n})$$

$$< cn^2 \sum_{i=0}^{\infty} \left(\frac{3}{16}\right)^i + \Theta(3^{\log_4 n})$$

$$= \frac{1}{1 - (3/16)} cn^2 + \Theta(3^{\log_4 n})$$

$$= \frac{16}{13} cn^2 + \Theta(3^{\log_4 n}) \quad ?$$

$$\sum_{k=0}^{\infty} x^k = \frac{1}{1-x}$$

let $x = 3/16$

21

Total cost

$$T(n) = \frac{16}{13} cn^2 + \Theta(3^{\log_4 n})$$

$$3^{\log_4 n} = 4^{\log_4 3^{\log_4 n}}$$

$$= 4^{\log_4 n \log_4 3}$$

$$= 4^{\log_4 n^{\log_4 3}}$$

$$= n^{\log_4 3}$$

$$T(n) = \frac{16}{13} cn^2 + \Theta(n^{\log_4 3})$$

$$T(n) = O(n^2) \quad \star$$

Assignment 1!

22

Recursion tree

If you went through the exact calculation (like we just did), you can be done!

Often, this isn't feasible (or desirable)

Instead, use the recursion tree to get a good guess

23

Verify solution using substitution

$$T(n) = 3T(n/4) + n^2$$

Assume $T(k) = O(k^2)$ for all $k < n$

Show that $T(n) = O(n^2)$

Given that $T(n/4) = O((n/4)^2)$, then

$$O(g(n)) = \left\{ f(n) : \begin{array}{l} \text{there exists positive constants } c \text{ and } n \text{ such that} \\ 0 \leq f(n) \leq cg(n) \text{ for all } n \geq n_0 \end{array} \right\}$$

$$T(n/4) \leq c(n/4)^2$$

24

$$T(n) = 3T(n/4) + n^2$$

To prove that Show that $T(n) = O(n^2)$ we need to identify the appropriate constants:

$$O(g(n)) = \left\{ f(n) : \begin{array}{l} \text{there exists positive constants } c \text{ and } n \text{ such that} \\ 0 \leq f(n) \leq cg(n) \text{ for all } n \geq n_0 \end{array} \right\}$$

i.e. some constant c such that $T(n) \leq cn^2$

$$\begin{aligned} T(n) &= 3T(n/4) + n^2 \\ &\leq 3c(n/4)^2 + n^2 \\ &= cn^2 \cdot 3/16 + n^2 \\ &= cn^2 - cn^2 * \frac{13}{16} + n^2 \quad \text{residual} \end{aligned}$$

a constant exists if, if $-cn^2 * \frac{13}{16} + n^2 \leq 0$

25

$$T(n) = 3T(n/4) + n^2$$

To prove that Show that $T(n) = O(n^2)$ we need to identify the appropriate constants:

$$O(g(n)) = \left\{ f(n) : \begin{array}{l} \text{there exists positive constants } c \text{ and } n \text{ such that} \\ 0 \leq f(n) \leq cg(n) \text{ for all } n \geq n_0 \end{array} \right\}$$

i.e. some constant c such that $T(n) \leq cn^2$

$$\begin{aligned} -cn^2 * \frac{13}{16} + n^2 &\leq 0 \\ cn^2 * \frac{13}{16} &\geq n^2 \\ c &\geq \frac{16}{13} \end{aligned}$$

26

Master Method

Provides solutions to the recurrences of the form:

$$T(n) = aT(n/b) + f(n)$$

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$

if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$

if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
then $T(n) = \Theta(f(n))$

27

$$T(n) = 16T(n/4) + n$$

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$

if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$

if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
then $T(n) = \Theta(f(n))$

$$\begin{aligned} a &= 16 & n^{\log_b a} &= n^{\log_4 16} \\ b &= 4 & &= n^2 \\ f(n) &= n & & \end{aligned}$$

is $n = O(n^{2-\epsilon})$?

is $n = \Theta(n^2)$?

is $n = \Omega(n^{2+\epsilon})$?

Case 1: $\Theta(n^2)$

28

$$T(n) = T(n/2) + 2^n$$

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$

if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$

if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
then $T(n) = \Theta(f(n))$

$$\begin{aligned} a &= 1 & n^{\log_b a} &= n^{\log_2 1} \\ b &= 2 & &= n^0 \\ f(n) &= 2^n & & \end{aligned}$$

is $2^n = O(n^{0-\epsilon})$?

is $2^n = \Theta(n^0)$?

is $2^n = \Omega(n^{0+\epsilon})$?

Case 3?

is $2^{n/2} \leq c2^n$ for $c < 1$?

29

$$T(n) = T(n/2) + 2^n$$

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$

if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$

if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
then $T(n) = \Theta(f(n))$

is $2^{n/2} \leq c2^n$ for $c < 1$?

Let $c = 1/2$

$$2^{n/2} \leq (1/2)2^n$$

$$2^{n/2} \leq 2^{-1}2^n$$

$$2^{n/2} \leq 2^{n-1}$$

$T(n) = \Theta(2^n)$

30

$T(n) = 2T(n/2) + n$

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$
 if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$
 if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
 then $T(n) = \Theta(f(n))$

$a = 2$ $n^{\log_b a} = n^{\log_2 2}$
 $b = 2$ $= n^1$
 $f(n) = n$

is $n = O(n^{1-\epsilon})$?
 is $n = \Theta(n^1)$? **Case 2: $\Theta(n \log n)$**
 is $n = \Omega(n^{1+\epsilon})$?

31

$T(n) = 16T(n/4) + n!$

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$
 if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$
 if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
 then $T(n) = \Theta(f(n))$

$a = 16$ $n^{\log_b a} = n^{\log_4 16}$
 $b = 4$ $= n^2$
 $f(n) = n!$

is $n! = O(n^{2-\epsilon})$? **Case 3?**
 is $n! = \Theta(n^2)$? is $16(n/4)! \leq cn!$ for $c < 1$?
 is $n! = \Omega(n^{2+\epsilon})$?

32

$T(n) = 16T(n/4) + n!$

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$
 if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$
 if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
 then $T(n) = \Theta(f(n))$

is $16(n/4)! \leq cn!$ for $c < 1$?

Let $c = 1/2$
 $cn! = 1/2n!$ **$T(n) = \Theta(n!)$**
 $> (n/2)!$

therefore,
 $16(n/4)! \leq (n/2)! < 1/2n!$

33

$T(n) = \sqrt{2}T(n/2) + \log n$

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$
 if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$
 if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
 then $T(n) = \Theta(f(n))$

$a = \sqrt{2}$ $n^{\log_b a} = n^{\log_2 \sqrt{2}}$
 $b = 2$ $= n^{\log_2 2^{1/2}}$
 $f(n) = \log n$ $= \sqrt{n}$

is $\log n = O(n^{1/2-\epsilon})$? **Case 1: $\Theta(\sqrt{n})$**
 is $\log n = \Theta(n^{1/2})$?
 is $\log n = \Omega(n^{1/2+\epsilon})$?

34

$T(n) = 4T(n/2) + n$

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$
 if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$
 if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
 then $T(n) = \Theta(f(n))$

$a = 4$ $n^{\log_b a} = n^{\log_2 4}$
 $b = 2$ $= n^2$
 $f(n) = n$

is $n = O(n^{2-\epsilon})$?
 is $n = \Theta(n^2)$? **Case 1: $\Theta(n^2)$**
 is $n = \Omega(n^{2+\epsilon})$?

35

Recurrences

$T(n) = 2T(n/3) + d$ $T(n) = 7T(n/7) + n$

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$
 if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$
 if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
 then $T(n) = \Theta(f(n))$

$T(n) = T(n-1) + \log n$ $T(n) = 8T(n/2) + n^3$

36

Why does the master method work?

$T(n) = aT(n/b) + f(n)$

37

What is the depth of the tree?

At each level, the size of the data is divided by b

$$\frac{n}{b^d} = 1$$

$$\log\left(\frac{n}{b^d}\right) = 0$$

$$\log n - \log 4^d = 0$$

$$d \log b = \log n$$

$$d = \log_b n$$

★

38

How many leaves?

How many leaves are there in a complete a -ary tree of depth d ?

$$a^d = a^{\log_b n}$$

$$= n^{\log_b a}$$

39

Total cost

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$
 if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$
 if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
 then $T(n) = \Theta(f(n))$

$$T(n) = cf(n) + af(n/b) + a^2 f(n/b^2) + \dots + a^{n-1} f(n/b^{n-1}) + \Theta(n^{\log_b a^3})$$

$$= \sum_{i=0}^{\log_b n-1} a^i f(n/b^i) + \Theta(n^{\log_b a})$$

Case 1: cost is dominated by the cost of the leaves

$$= \sum_{i=0}^{\log_b n-1} a^i f(n/b^i) < \Theta(n^{\log_b a})$$

40

Total cost

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$
 if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$
 if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
 then $T(n) = \Theta(f(n))$

$$T(n) = cf(n) + af(n/b) + a^2 f(n/b^2) + \dots + a^{n-1} f(n/b^{n-1}) + \Theta(n^{\log_b a^3})$$

$$= \sum_{i=0}^{\log_b n-1} a^i f(n/b^i) + \Theta(n^{\log_b a})$$

Case 2: cost is evenly distributed across tree

As we saw with mergesort, $\log n$ levels to the tree and at each level $f(n)$ work

41

Total cost

if $f(n) = O(n^{\log_b a - \epsilon})$ for $\epsilon > 0$, then $T(n) = \Theta(n^{\log_b a})$
 if $f(n) = \Theta(n^{\log_b a})$, then $T(n) = \Theta(n^{\log_b a} \log n)$
 if $f(n) = \Omega(n^{\log_b a + \epsilon})$ for $\epsilon > 0$ and $af(n/b) \leq cf(n)$ for $c < 1$
 then $T(n) = \Theta(f(n))$

$$T(n) = cf(n) + af(n/b) + a^2 f(n/b^2) + \dots + a^{d-1} f(n/b^{d-1}) + \Theta(n^{\log_b a^3})$$

$$= \sum_{i=0}^{\log_b n-1} a^i f(n/b^i) + \Theta(n^{\log_b a})$$

Case 3: cost is dominated by the cost of the root

42

Other forms of the master method

$$T(n) = aT(n/b) + O(n^d)$$

$$T(n) = \begin{cases} O(n^d) & \text{if } d > \log_b a \\ O(n^d \log n) & \text{if } d = \log_b a \\ O(n^{\log_b a}) & \text{if } d < \log_b a \end{cases}$$
