

# Merge Sort

<https://cs.pomona.edu/classes/cs140/>

# Outline

## Topics and Learning Objectives

- Learn how the **merge sort** algorithm operates
- Become aware of the “**Divide and Conquer**” algorithmic paradigm by analyzing merge sort

## Exercise

- Recursion tree

# Extra Resources

- CLRS (Cormen Book): Chapter 4
- Algorithms Illuminated: Part 1: Chapter 1

# Divide and Conquer

- This is an algorithm design paradigm
- Most divide and conquer algorithms are recursive in nature
- The basic idea is to break the problem into easier-to-solve subproblems
  
- What's easier to do:
  - Sort 0, 1, or 2 numbers, or
  - Sort 10 numbers

# Merge Sort

- This is a “Divide and Conquer”-style algorithm
- Improves over insertion sort in the worst case
- Unlike insertion sort, the best/average/worst case running times of merge sort are all the same

What is the running time of each line?

**FUNCTION** MergeSort(array)

n = array.length

**IF** n == 1

**RETURN** array

left\_sorted = MergeSort(array[0 ..< n//2])

right\_sorted = MergeSort(array[n//2 ..< n])

array\_sorted = Merge(left\_sorted, right\_sorted)

**RETURN** array\_sorted

What is the running time of each line?

**FUNCTION** MergeSort(array)

$O(1)$  = array.length

$O(1)$  n == 1

$O(1)$  **RETURN** array

$O(?)$  left\_sorted = MergeSort(array[0 ..< n//2])

$O(?)$  right\_sorted = MergeSort(array[n//2 ..< n])

array\_sorted = Merge(left\_sorted, right\_sorted)

**RETURN** array\_sorted

What is the running time of each line?

$T(n)$  **FUNCTION** MergeSort(array)

$O(1)$  = array.length

$O(1)$  n == 1

$O(1)$  **RETURN** array

$T(n/2)$  left\_sorted = MergeSort(array[0 ..< n//2])

$T(n/2)$  right\_sorted = MergeSort(array[n//2 ..< n])

array\_sorted = Merge(left\_sorted, right\_sorted)

**RETURN** array\_sorted

What is the running time of each line?

$T(n)$  **FUNCTION** MergeSort(array)

$O(1)$  = array.length

$O(1)$  n == 1

$O(1)$  **RETURN** array

$T(n/2)$  left\_sorted = MergeSort(array[0 ..< n//2])

$T(n/2)$  right\_sorted = MergeSort(array[n//2 ..< n])

$O(?)$  array\_sorted = Merge(left\_sorted, right\_sorted)

$O(1)$  **RETURN** array\_sorted

What is the running time of each line?

$T(n)$  **FUNCTION** MergeSort(array)

$O(1)$  = array.length

$O(1)$  n == 1

$O(1)$  **RETURN** array

$$\begin{aligned} T(n) &= 2 T(n/2) + O(?) + 4 O(1) \\ &= 2 T(n/2) + O(?) \end{aligned}$$

$T(n/2)$  left\_sorted = MergeSort(array[0 ..< n//2])

$T(n/2)$  right\_sorted = MergeSort(array[n//2 ..< n])

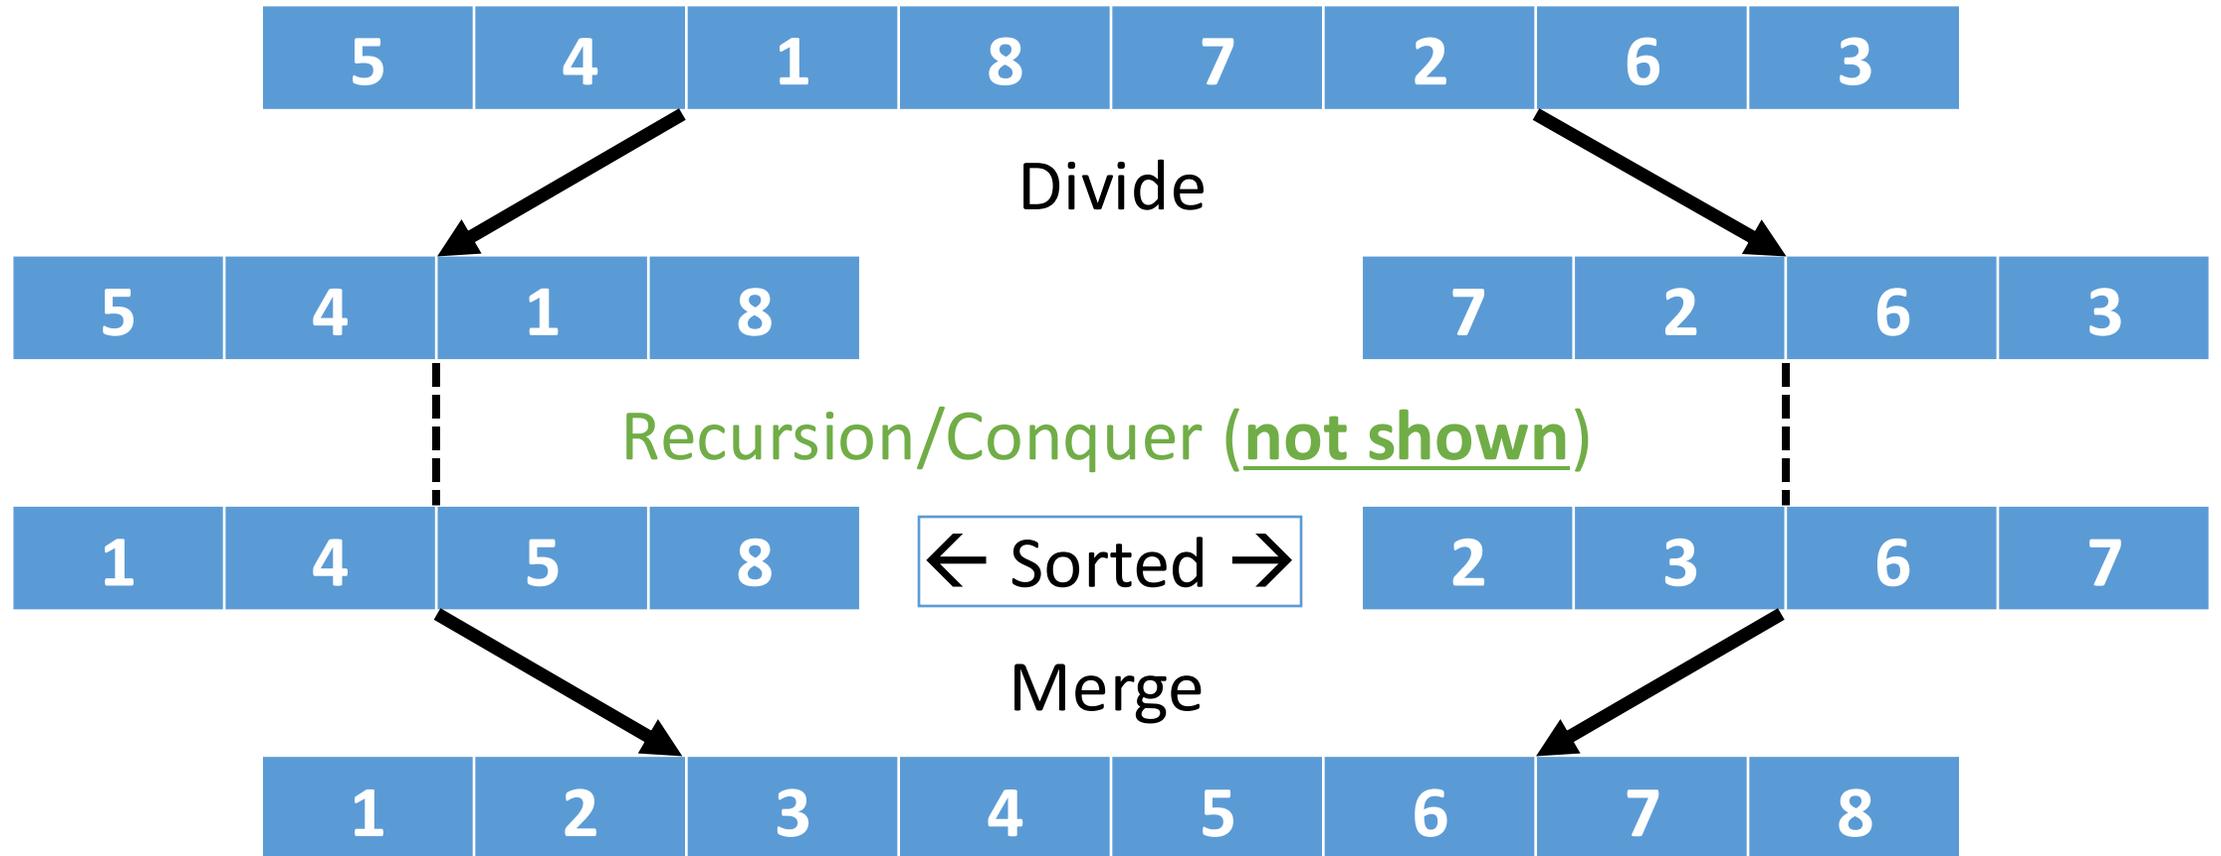

$O(?)$  array\_sorted = Merge(left\_sorted, right\_sorted)

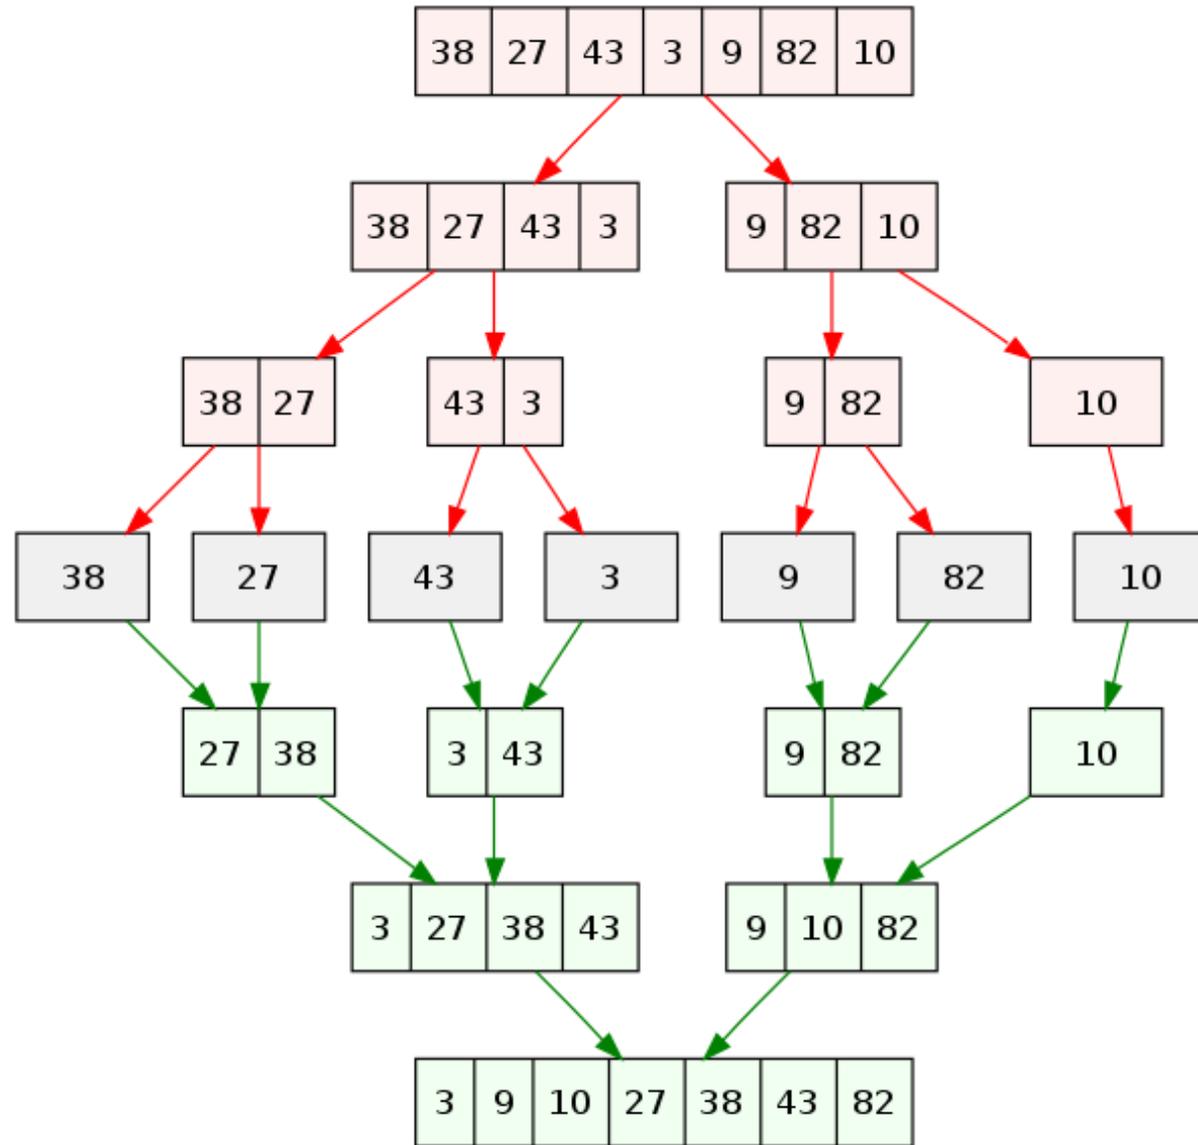

$O(1)$  **RETURN** array\_sorted

# Recurrence Equation

$$\begin{aligned} T(n) &= 2 T(n/2) + O(?) + 4 O(1) \\ &= 2 T(n/2) + O(?) \end{aligned}$$

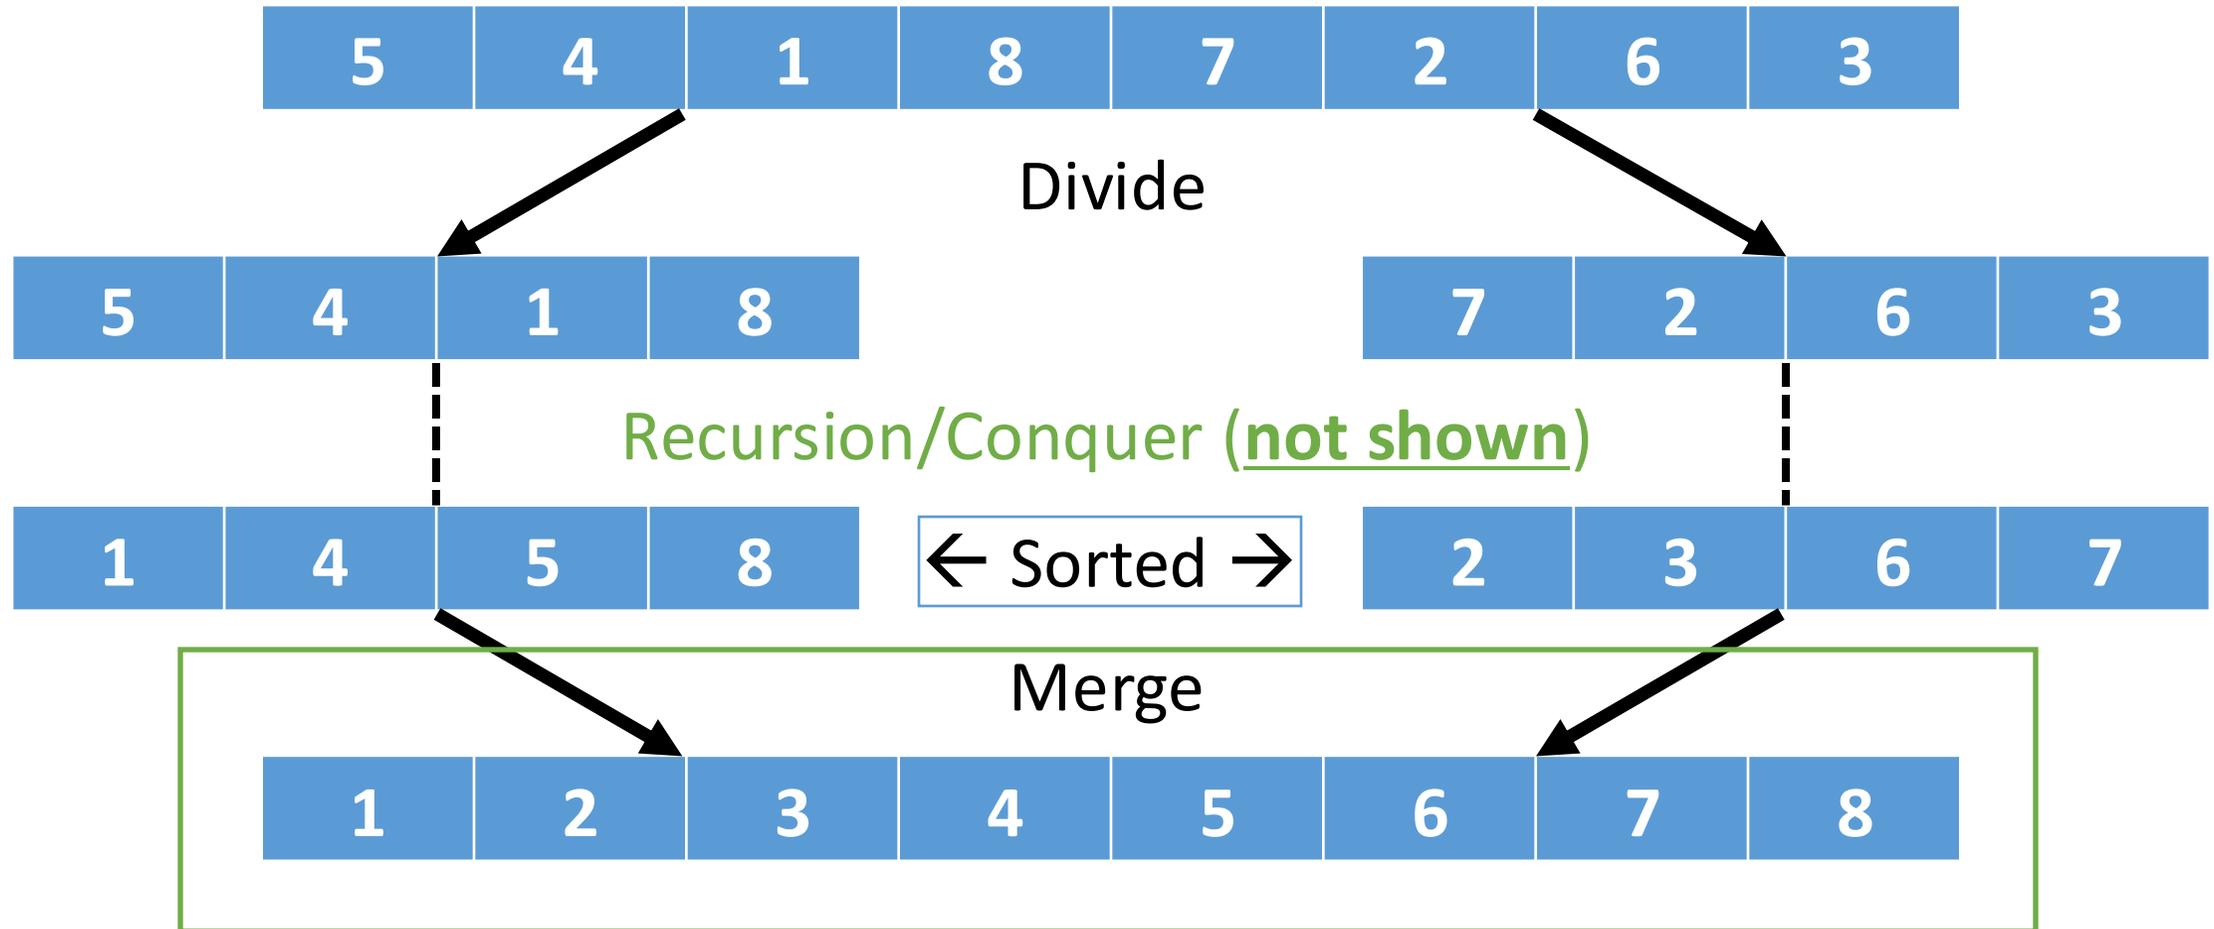

# Merge Sort

# Merge Sort

Write the **Merge** routine

**FUNCTION** Merge(one, two)

out[one.length + two.length] *# Declare array*

**FUNCTION** Merge(one, two)

out[one.length + two.length]

i = j = k = 0

**WHILE** k < out.length

**IF** one[i] < two[j]

out[k] = one[i]

i = i + 1

Ignoring  
invalid  
indices

**ELSE**

out[k] = two[j]

j = j + 1

k = k + 1

What is the total  
running time?

**FUNCTION** Merge(one, two)

out[one.length + two.length]

i = j = k = 0

**WHILE** k < out.length

**IF** one[i] < two[j]

out[k] = one[i]

i = i + 1

**ELSE**

out[k] = two[j]

j = j + 1

k = k + 1

Total Running Time

3 m

2 m

2 m

Ignoring invalid indices

$$T_{\text{merge}}(m) = 12m + 9$$

# Simplifying the running time

- We don't need to be *exactly* correct with the running time of **Merge**
- We will eventually remove lower order terms anyway
- Let's simplify the expression a bit:

$$T_{merge}(m) = 12m + 9$$

$$T_{merge}(m) \leq 12m + 9m$$

$$T_{merge}(m) \leq 21m$$

# Merging

We have an idea of the cost of an individual call to merge:

$$T(m) \leq 21m$$

What else do we need to know to calculate the total time of **MergeSort**?

1. How many times do we merge in total?
2. What is the size of each merge? (In other words: **What is  $m$ ?**)

What is the running time of each line?

$T(n)$  **FUNCTION** MergeSort(array)

$O(1)$  = array.length

$O(1)$  n == 1

$O(1)$  **RETURN** array

$$\begin{aligned} T(n) &= 2 T(n/2) + O(?) + 4 O(1) \\ &= 2 T(n/2) + O(?) \end{aligned}$$

$T(n/2)$  left\_sorted = MergeSort(array[0 ..< n//2])

$T(n/2)$  right\_sorted = MergeSort(array[n//2 ..< n])

$O(?)$  array\_sorted = Merge(left\_sorted, right\_sorted)

$O(1)$  **RETURN** array\_sorted

What is the running time of each line?

$T(n)$  **FUNCTION** MergeSort(array)

$O(1)$  = array.length

$O(1)$  n == 1

$O(1)$  **RETURN** array

$$\begin{aligned} T(n) &= 2 T(n/2) + O(n) + 4 O(1) \\ &= 2 T(n/2) + O(n) \end{aligned}$$

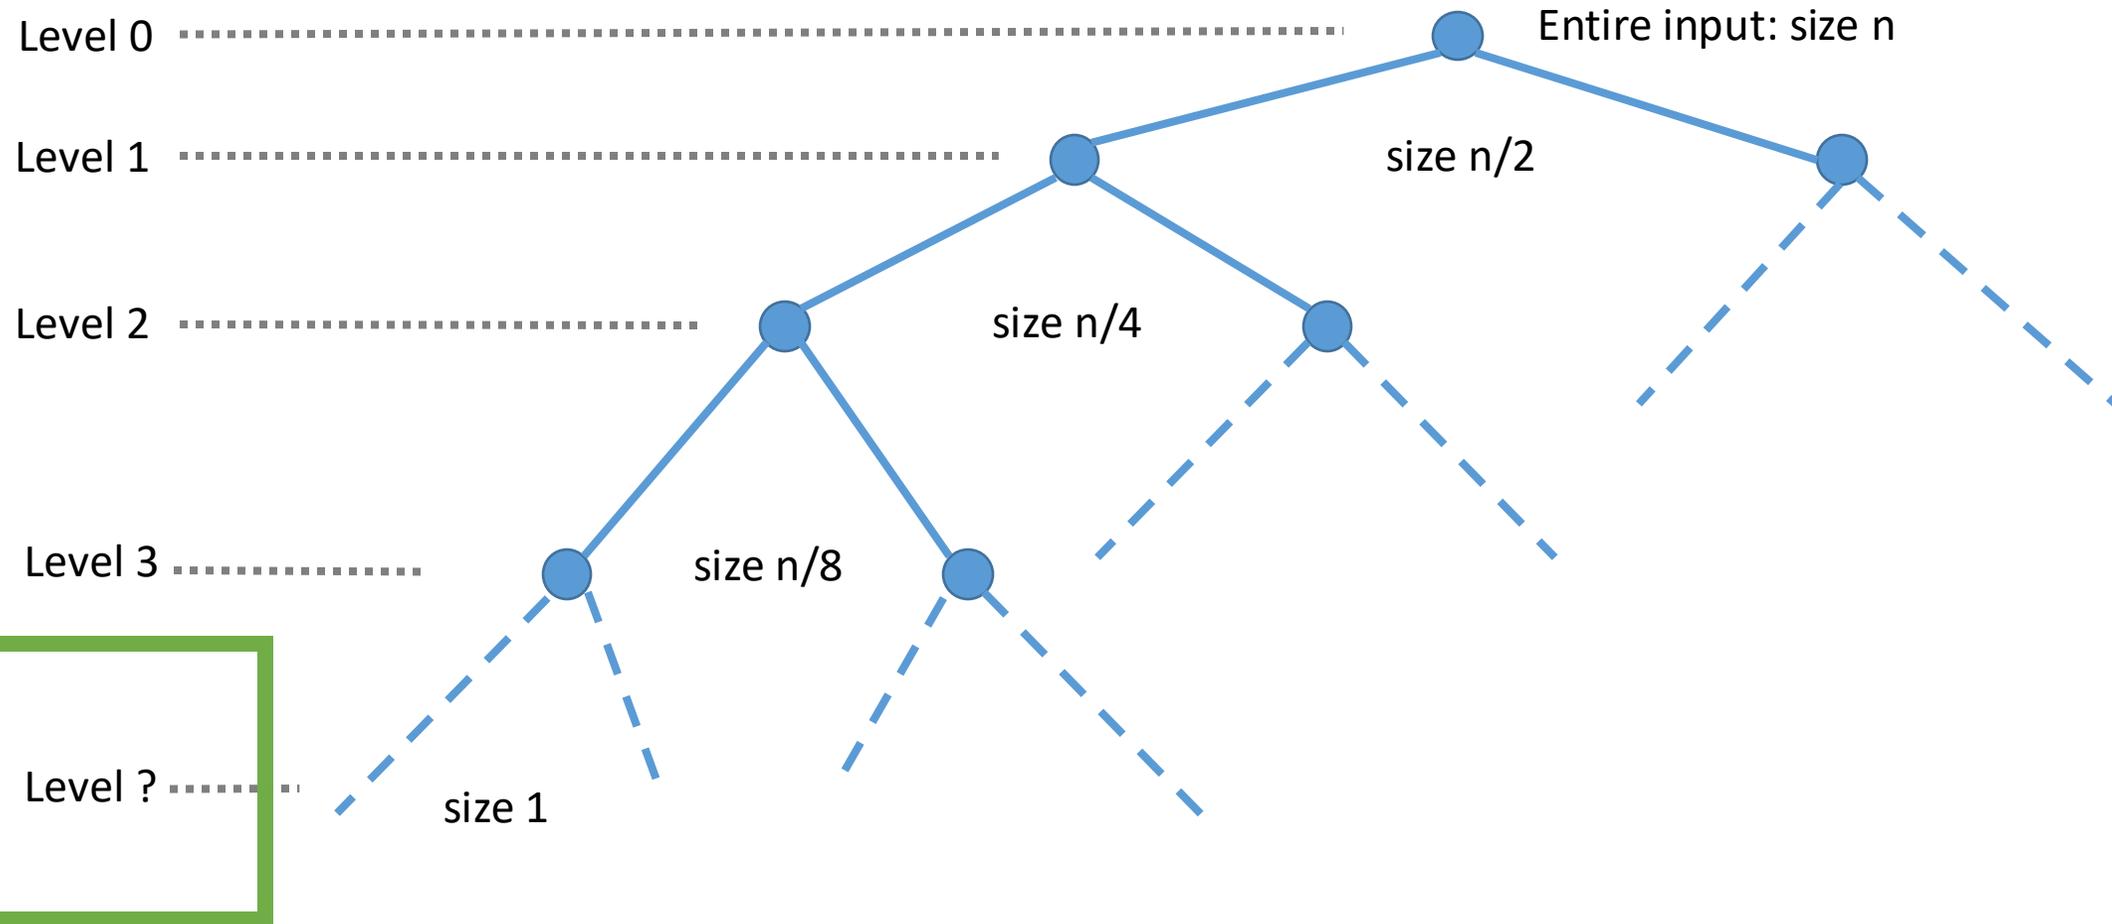

$T(n/2)$  left\_sorted = MergeSort(array[0 ..< n//2])

$T(n/2)$  right\_sorted = MergeSort(array[n//2 ..< n])

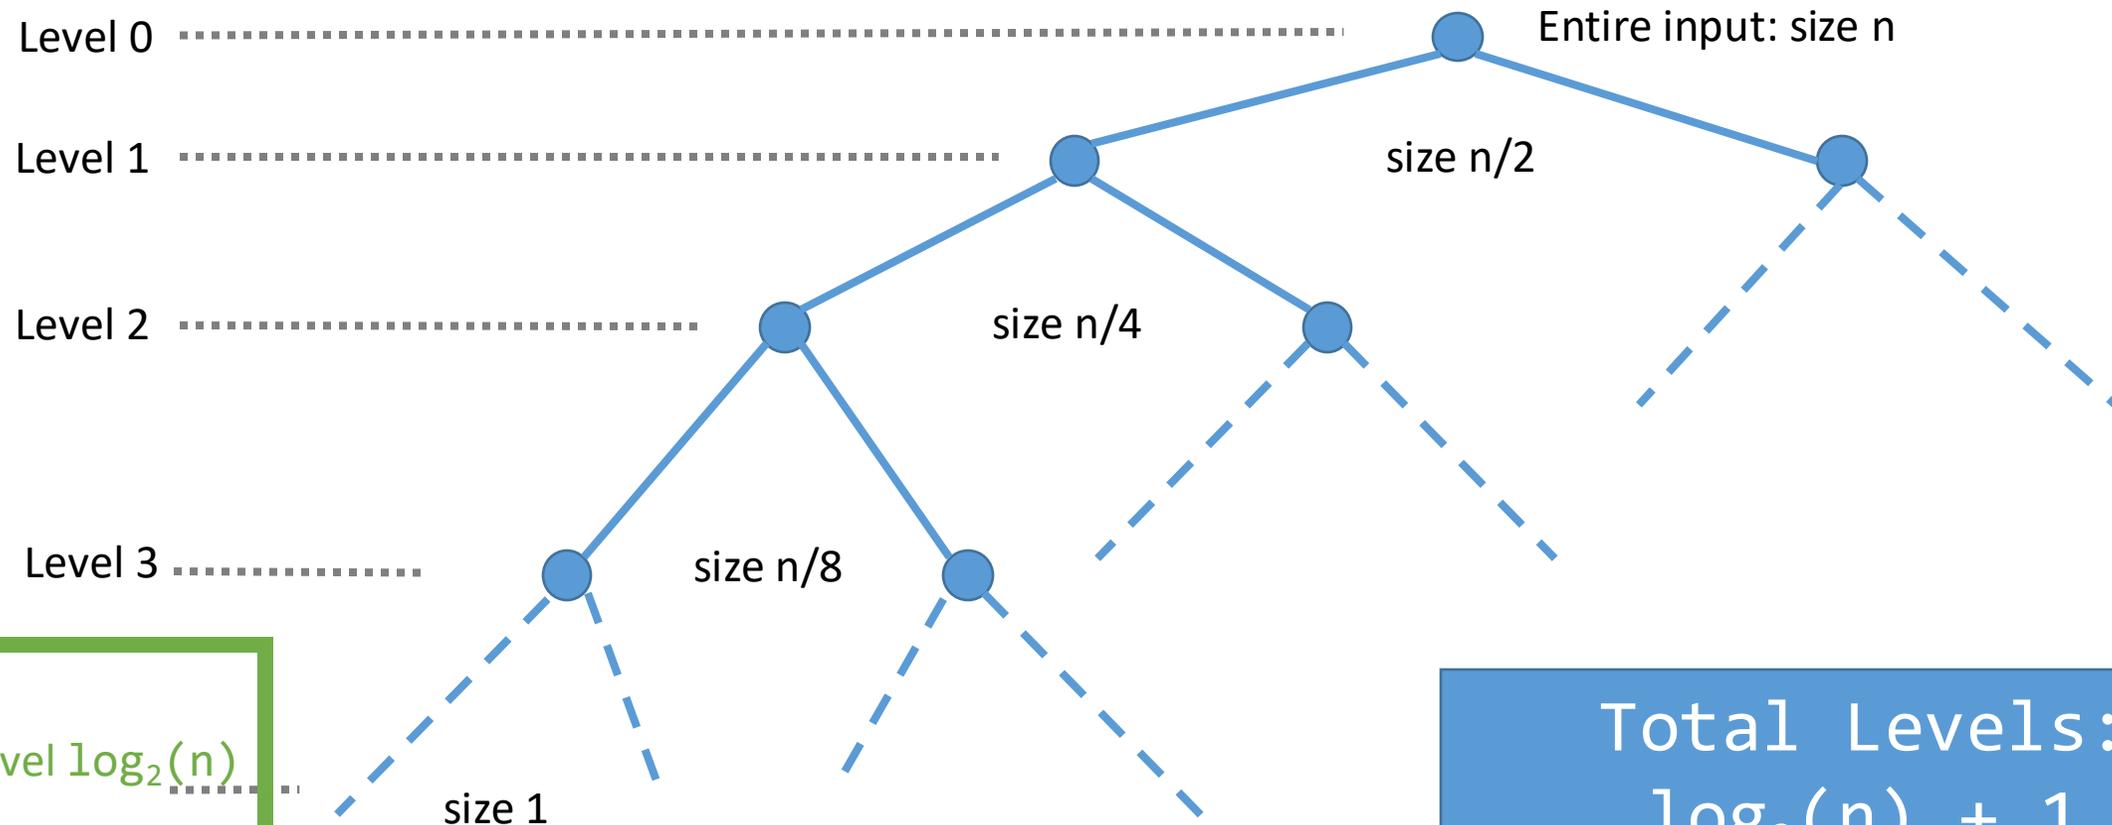

$O(n)$  array\_sorted = Merge(left\_sorted, right\_sorted)

$O(1)$  **RETURN** array\_sorted

# How many times do we call Merge?

# How many times do we call Merge?

Total Levels:  
 $\log_2(n) + 1$

# Exercise

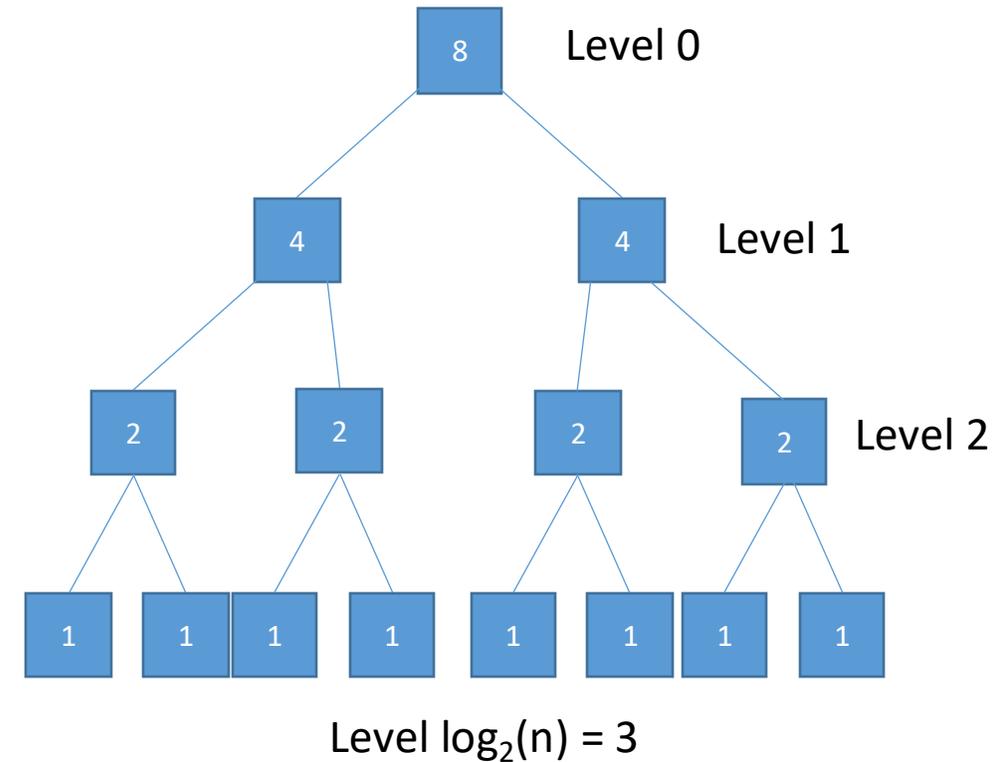

How many sub-problems are there at level  $L$ ? The top level is Level  $0$ , the second level is Level  $1$ , and the bottom level is Level  $\log_2(n)$

Answer:  $2^L$

How many elements are there for a given sub-problem found in level  $L$ ?

Answer:  $n/2^L$

How many computations are performed at a given level?  
The cost of a Merge was  $21m$ .

# Exercise

How many sub-problems are there at level  $L$ ? The top level is Level  $0$ , the second level is Level  $1$ , and the bottom level is Level  $\log_2(n)$

Answer:  $2^L$

How many elements are there for a given sub-problem found in level  $L$ ?

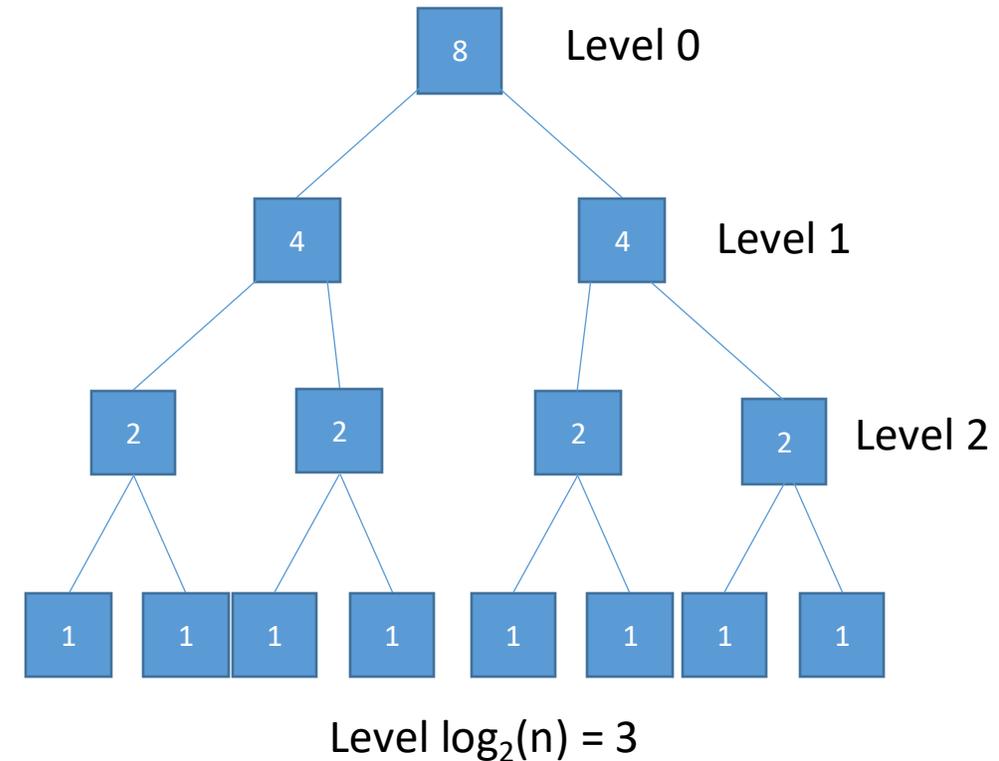

Answer:  $n/2^L$

How many computations are performed at a given level? The cost of a Merge was  $21m$ .

Answer:  $2^L \cdot 21(n/2^L) \rightarrow 21n$

What is the total computational cost of merge sort?

Answer:  $21n (\log_2(n) + 1)$

# Exercise

Answer:  $2^L$

How many elements are there for a given sub-problem found in level  $L$ ?

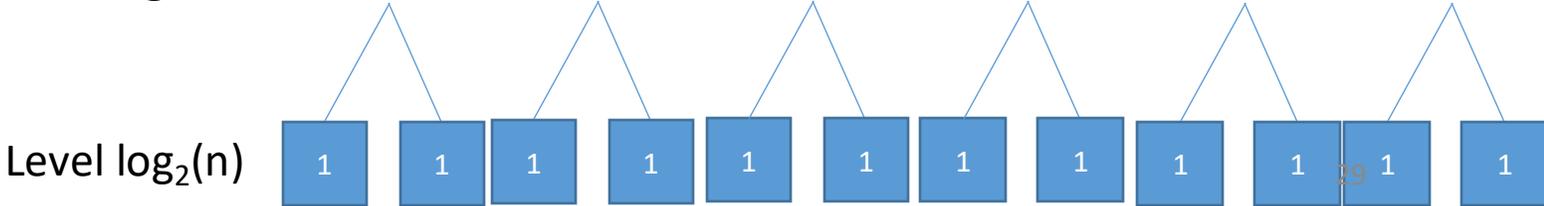

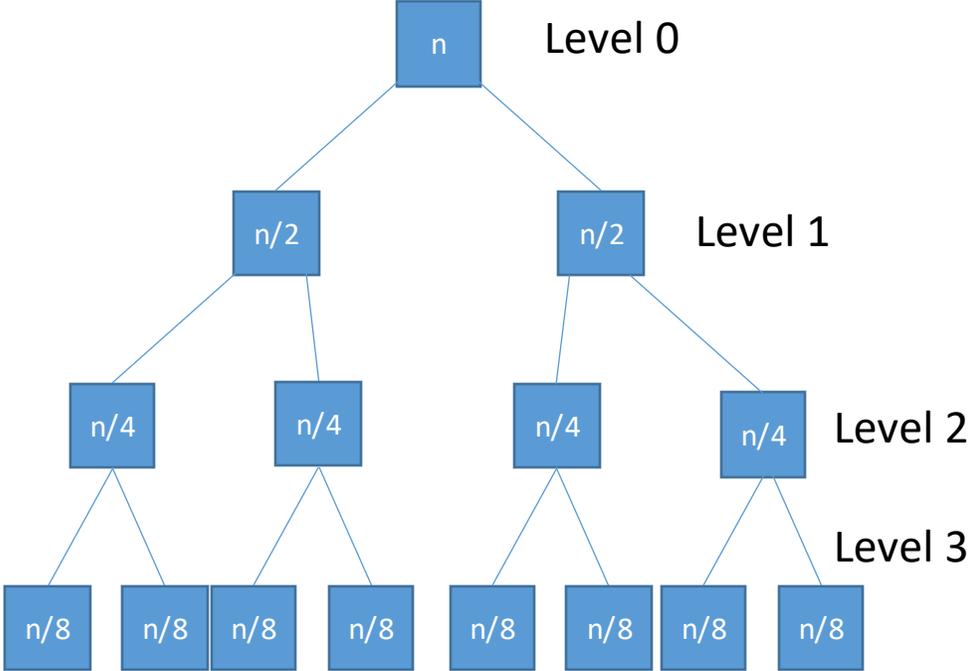

Answer:  $n/2^L$

How many computations are performed at a given level? The cost of a Merge was  $21m$ .

Answer:  $2^L \cdot 21(n/2^L) \rightarrow 21n$

What is the total computational cost of merge sort?

Answer:  $21n (\log_2(n) + 1)$

# Merge Sort

Divide and Conquer

- constantly halving the problem size and then merging

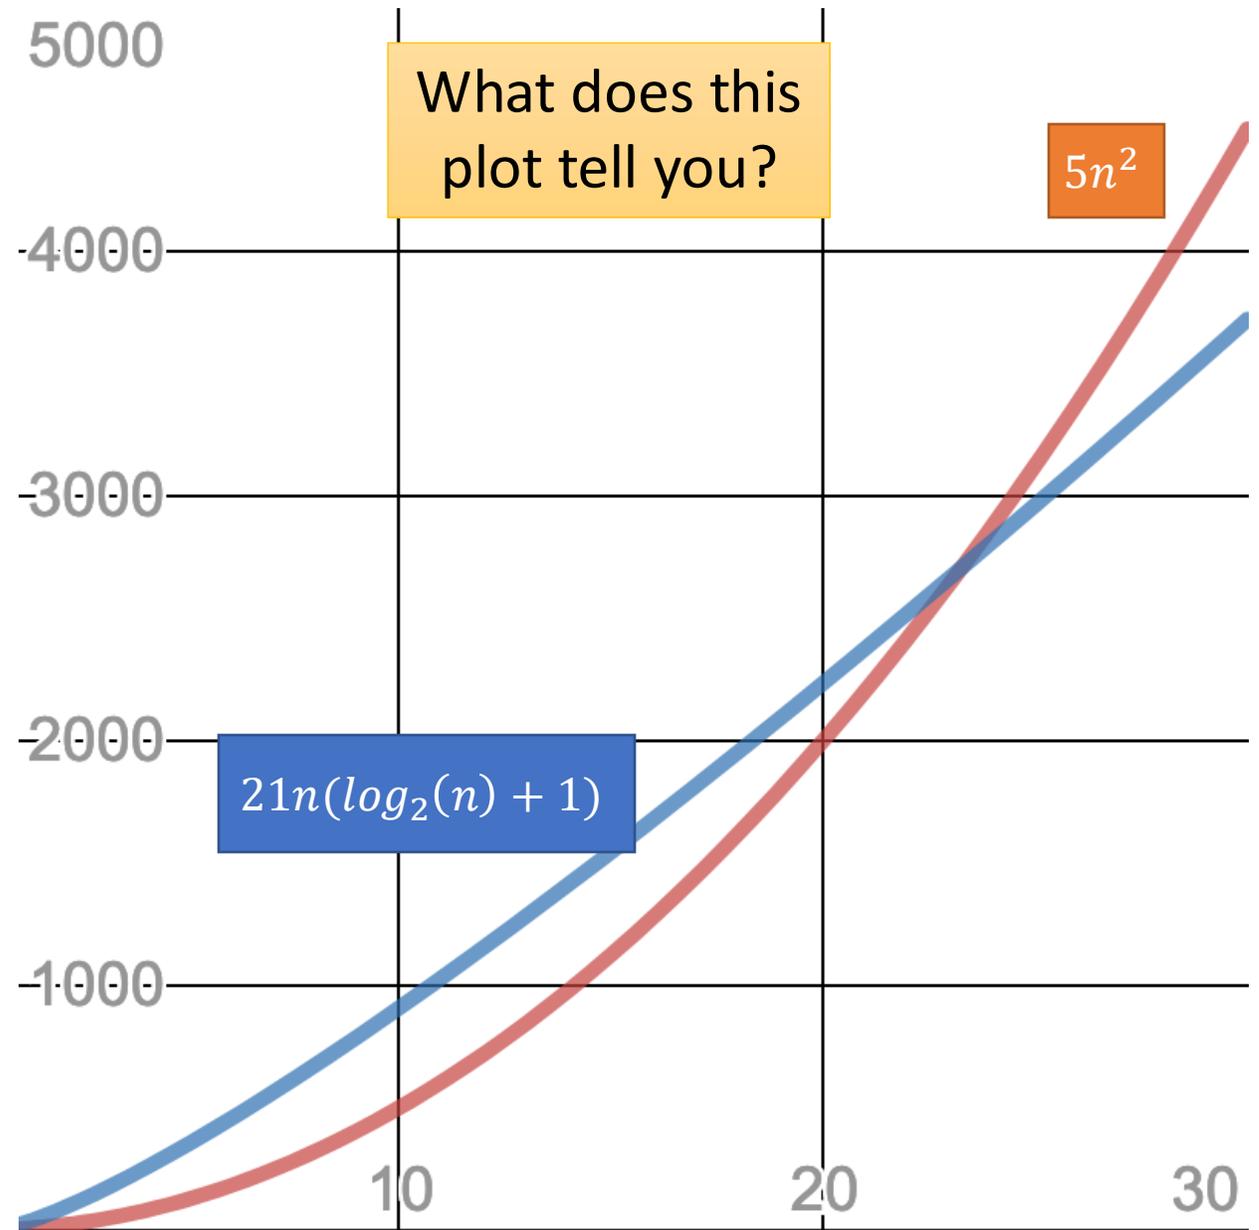

**Total running time** of roughly  $21n \log_2(n) + 21n$

Compared to insertion sort with an **average total running time** of  $\frac{1}{2} n^2$

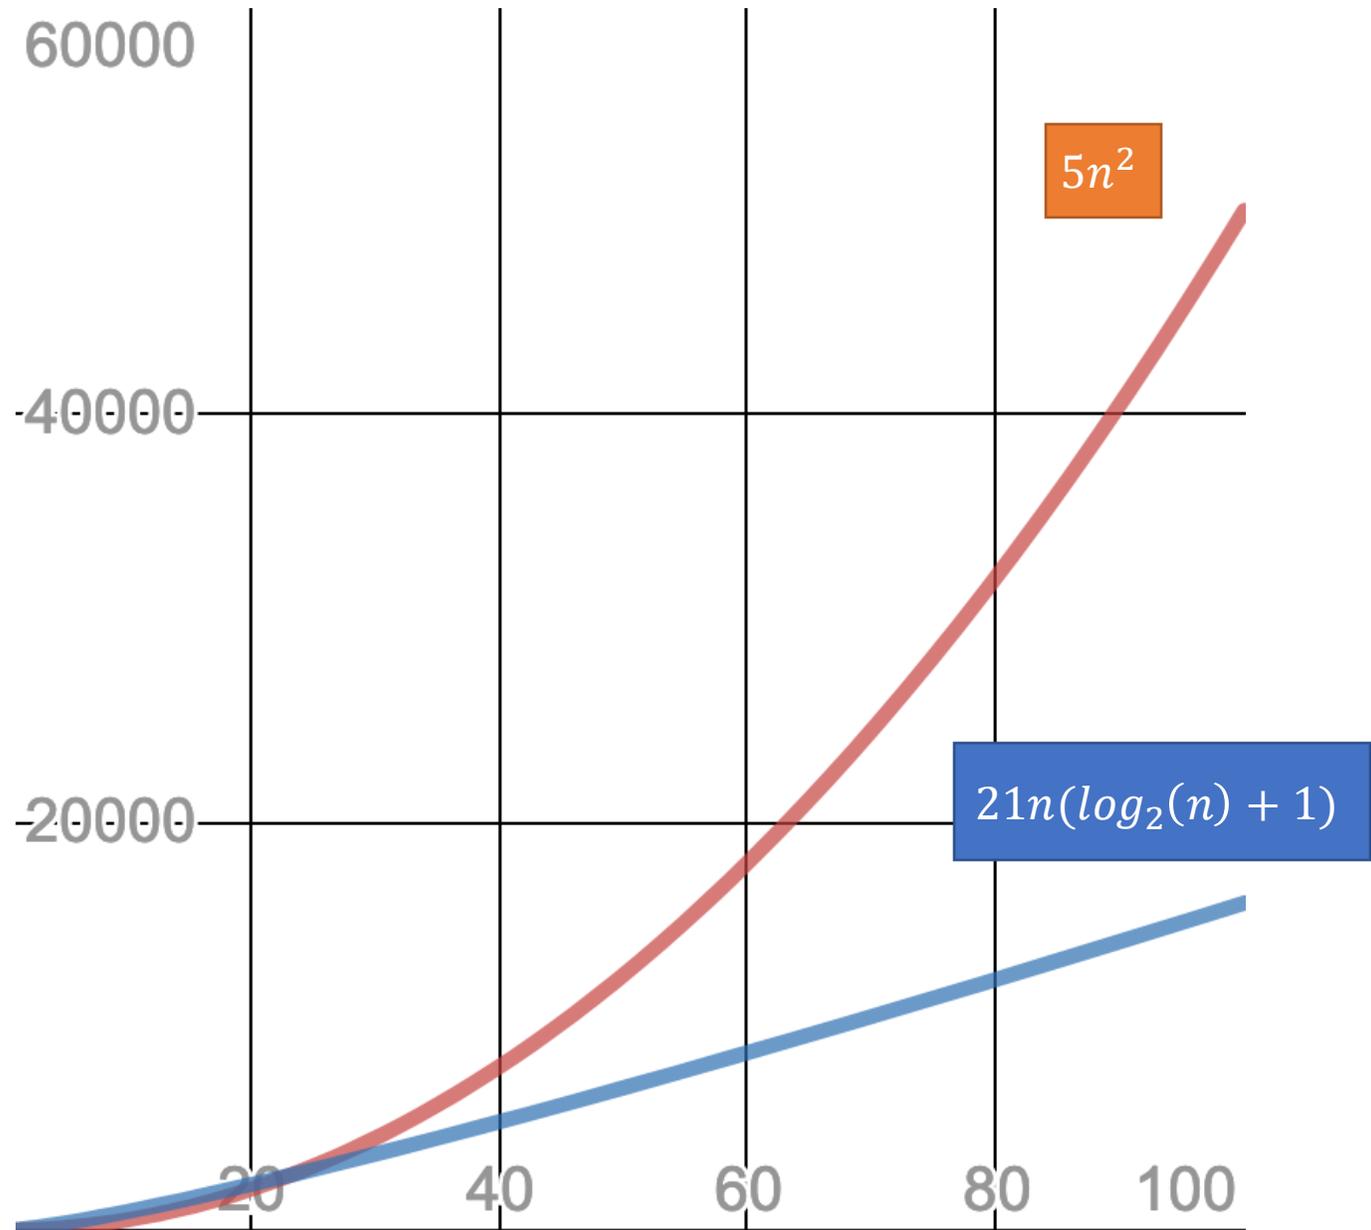

- For small values of  $n$ , insertion sort is better

Which algorithm is **better**?
