Assignment 4b

Quiz #2 next Wednesday covering material through 3/1

2

Course feedback

Maybe including some content related to more recent NLP stuff would be interesting

Course feedback

Assignments need to be less vague, more detail on how we actually implement it. They are very interesting, but also very difficult.

Assignments could be more detailed

Course feedback

Not gonna lie, this class feels a lot harder than most of my other cs classes. The structure of the class feels less intuitive, and though related to the class material, the homeworks seem much harder than what we go over in class

way too much workload

the homeworks are veeery hard and time consuming

9

Text Similarity A common question in NLP is how similar are texts score: sim(,) = ? rank: ? How could these be useful? Applications?

Course feedback

time.

10

Maybe if we had a constant due date for assignments

(like same day every week), we'd be able to organize

assignment and attending mentor sessions harder. If it was the same time every week, I feel like I would

time better. There have been times I was less free

eventually find a routine for getting things done in

before deadlines which made completing the

11

Text similarity: application

Automatic grader

Question: what is a variable?

Answer: a location in memory that can store a value

How good are:

- a variable is a location in memory where a value can be stored
- a named object that can hold a numerical or letter value
- it is a location in the computer 's memory where it can be stored for use by a program
- a variable is the memory address for a specific type of stored data or from a mathematical perspective a symbol representing a fixed definition with changing values
- · a location in memory where data can be stored and retrieved

17

Text similarity

There are many different notions of similarity depending on the domain and the application

Today, we'll look at some different tools

There is no one single tool that works in all domains

18

- Doesn't take into account word order
- Related: doesn't reward longer overlapping sequences
- A: defendant his the When lawyer into walked backs him the court, of supporters and some the victim turned their backs him to.
- B: When the defendant walked into the courthouse with his attorney, the crowd truned their backs on him.

sim(T1, T2) = 11

22

Word overlap problems

Treats all words the same

- A: When the defendant and his lawyer walked into the court, some of the victim supporters turned their backs to him.
- B: When the defendant walked into the courthouse with his attorney, the crowd truned their backs on him.

26

May not handle frequency properly

- A: When the defendant and his lawyer walked into the court, some of the victim supporters turned their backs to him. I ate a *banana* and then another *banana* and it was good!
- B: When the defendant walked into the courthouse with his attorney, the crowd truned their backs on him. I ate a large banana at work today and thought it was great!

28

Word overlap: sets

What is the overlap, using set notation? $\square |A \cap B|$ the size of the intersection

How can we incorporate length/size into this measure?

Word overlap: sets What is the overlap, using set notation? $|A \cap B| \text{ the size of the intersection}$ How can we incorporate length/size into this measure? Jaccard index (Jaccard similarity coefficient) $J(A,B) = \frac{|A \cap B|}{|A \cup B|}$ Dice's coefficient $Dice(A,B) = \frac{2 |A \cap B|}{|A| + |B|}$ 30

29

31

Bag of words representation

When the defendant and his lawyer walked into the court, some of the victim supporters turned their backs to him.

When the defendant and his lawyer walked into the court, some of the victim supporters turned their backs to him.

34

What information do we lose?

Cosine as a similarity

$$sim_{cos'}(A,B) = A \cdot B = \sum_{i=1}^{n} a_i b_i \qquad \text{ignoring length} \\ \text{normalization} \qquad \text{Just another distance measure, like the others:} \\ dist_{L2}(A,B) = \sqrt{\sum_{i=1}^{n} (a_i - b_i)^2} \\ dist_{L1}(A,B) = \sum_{i=1}^{n} |a_i - b_i|$$

ignoring length

Cosine as a similarity

 $sim_{cos'}(A,B) = A \cdot B = \sum_{i=1}^{n} a_i b_i$

Only words that occur in both documents count towards similarity

Words that occur more frequently in both receive more weight

50

Distance measures

 $sim_{cos}(A,B) = A \cdot B = \sum_{i=1}^{n} a'_i b'_i$

 $dist_{L2}(A,B) = \sqrt{\sum_{i=1}^{n} (a'_i - b'_i)^2}$

 $dist_{L1}(A,B) = \sum_{i=1}^{n} |a'_i - b'_i|$

Cosine is the most

do you think?

common measure. Why

Cosine

L2

L1

54

,

Word overlap problems

Ideas?

A: When the defendant and his lawyer walked into the

B: When the defendant walked into the courthouse with his attorney, the crowd truned their backs on him.

court, some of the victim supporters turned their backs

Treats all words the same

to him.

58

ldea: use corpus	statistics
the defendant	
What would be a quantitative measure of word importance?	

Fr	om doc	ument freq	uency to weigh
	Word	Collection frequency	Document frequency
	insurance	10440	3997
	try	10422	8760
	weight and document frequency are inversely related higher document frequency should have lower weight and vice versa document frequency is unbounded		
		ncy will change depeners er of documents)	nding on the size of the date

	idf
1	
100	
1,000	
10,000	
100,000	
1,000,000	
	100 1,000 10,000 100,000

IDF examp	le, suppose N	=1 million
term	dfr	idfr
calpurnia	1	6
animal	100	4
sunday	1,000	3
fly	10,000	2
under	100,000	1
the	1,000,000	0

There is one idf value/weight for each word

67

68

he		1,000,000	
he		1,000,000	

69

TF-IDF	
One of the most common weighting schemes	
TF = term frequency	
IDF = inverse document frequency $a'_{i} = a_{i} \times \log N / df_{i}$ TF IDF (word importance weight)	
We can then use this with any of our similarity measures!	

Stoplists: extreme weighting
• • • • • • • • • • •
Some words like 'a' and 'the' will occur in almost every
IDF will be 0 for any word that occurs in all documents
For words that occur in almost all of the documents, they will be nearly 0
A stoplist is a list of words that should not be considered (in
this case, similarity calculations)

IDF example, suppose N=1 million

What if we didn't use the log to dampen the weighting?

1 100

1,000

10,000

100,000

1,000,000

Sometimes this is the n most frequent words

Often, it's a list of a few hundred words manually created
