CS181DT Class 15: Prototyping

Three different paper prototypes for the same idea

http://courses.csail.mit.edu/6.831/2014/readings/L10-prototyping/#paper-prototypes

Class 15 agenda

- Lecture: From design goals to designs: prototyping!
- Break
- Studio: Paper prototypes (wireframes)

Announcements

• Remember, all P2 checkpoints will *not* affect your final P2 grade. They're for feedback only

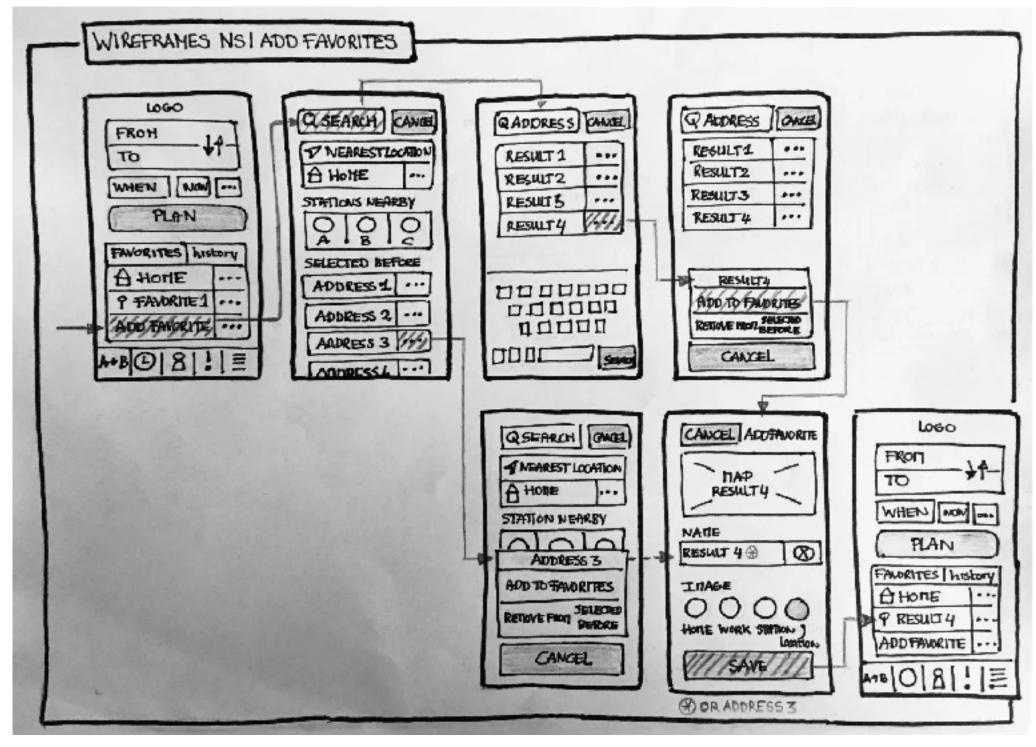

From design goals to design

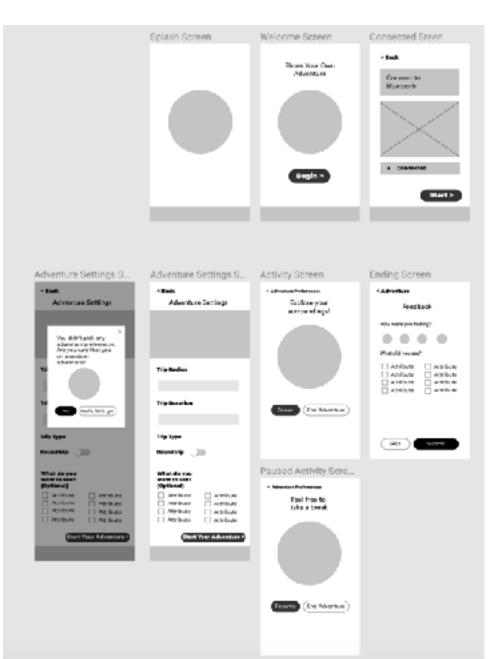

- Prototypes are instantiations of idea and design principles
- Prototypes force you to make design decisions
- This class we'll be making low fidelity *paper prototypes*. Benefits of paper:
 - Faster to build
 - Easier to change
 - Focuses attention on big picture rather than nitpicking UI details

Prototypes are instantiations of ideas that can be informed by your user needs

Wireframe

- A wireframe is an architectural representation of a user interface like a screen, window, dialog box or web page.
- Wireframes visually depict the basic layout of an app or website. They typically lack style, color, and graphics as their purpose is to test functionality and determine priority of content.

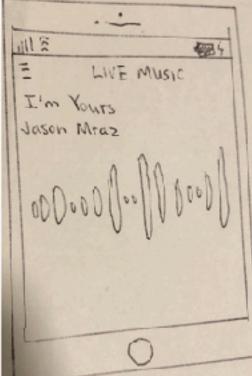

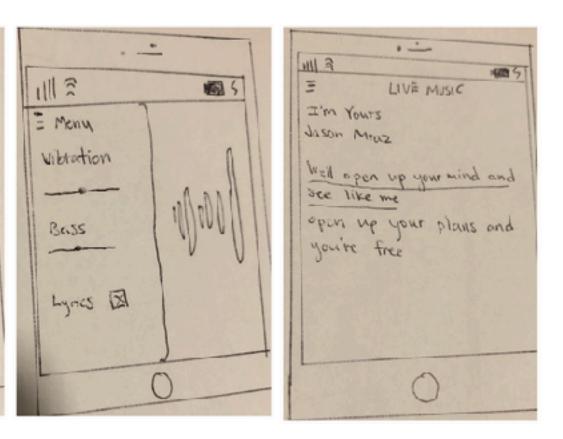

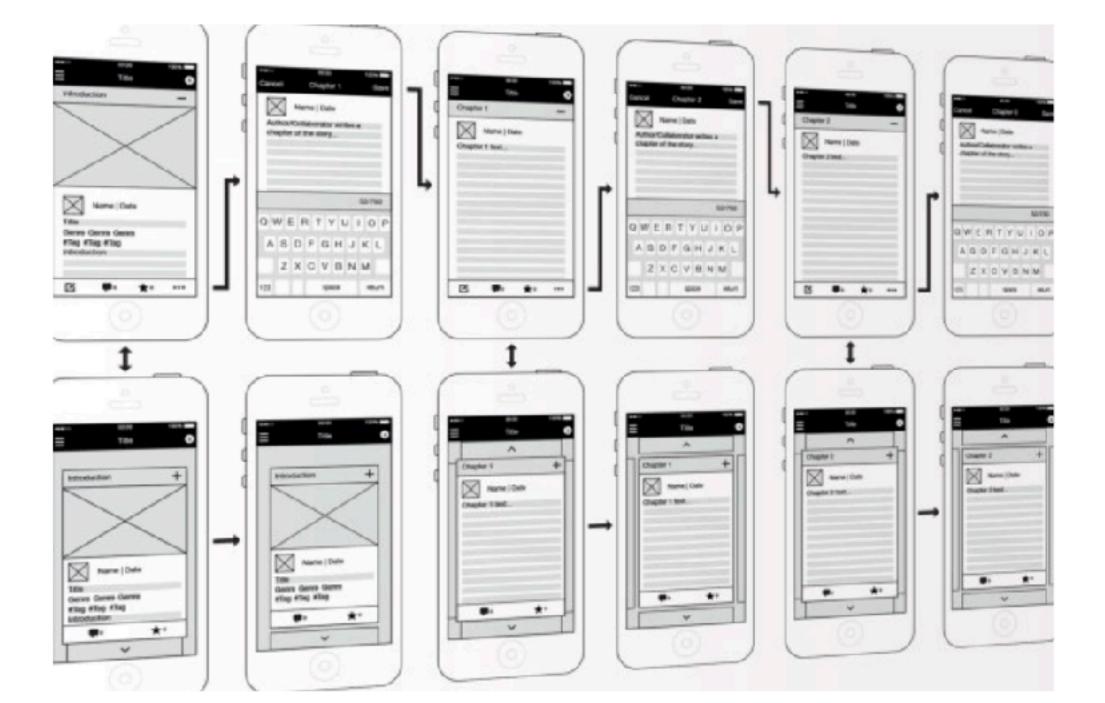

Sketch vs wireframe

Sketch

Wireframe

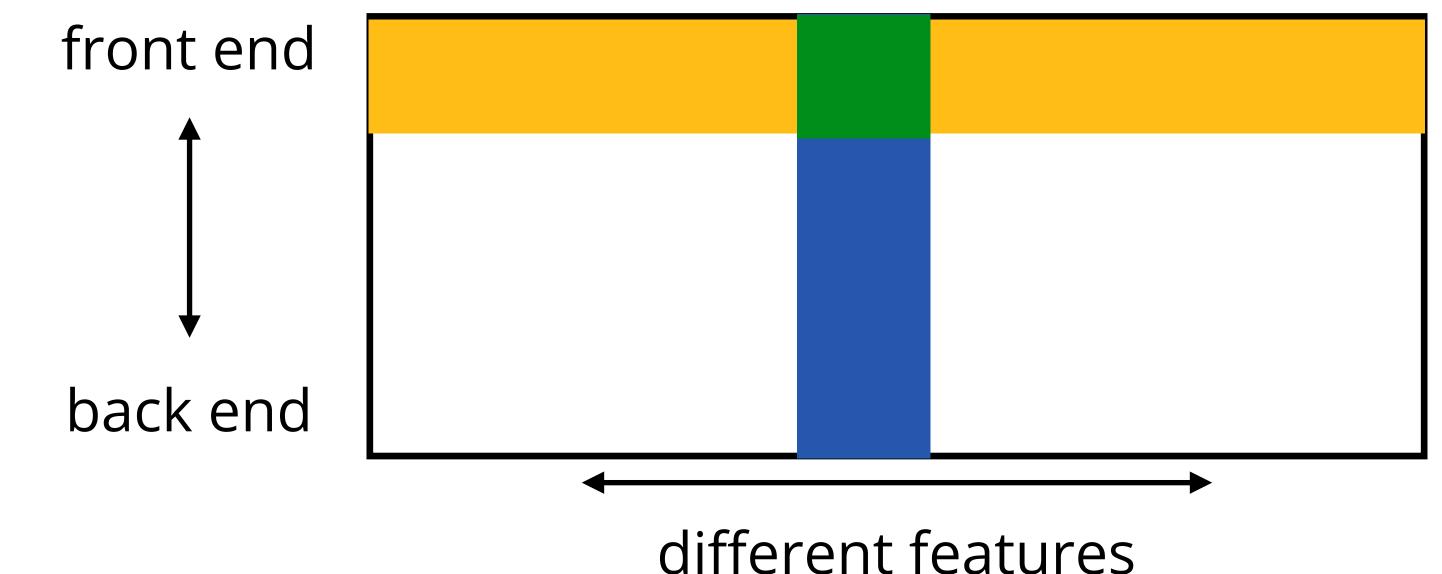

A wireframe fleshes out more details than a sketch, such as specific UI elements

Prototype fidelity is multidimensional

- Breadth (horizontal) how many features does your prototype cover?
- Depth (vertical) degree of functionality (how responsive to user inputs is your prototype? Or does it just have "canned" options)

scenario (today)

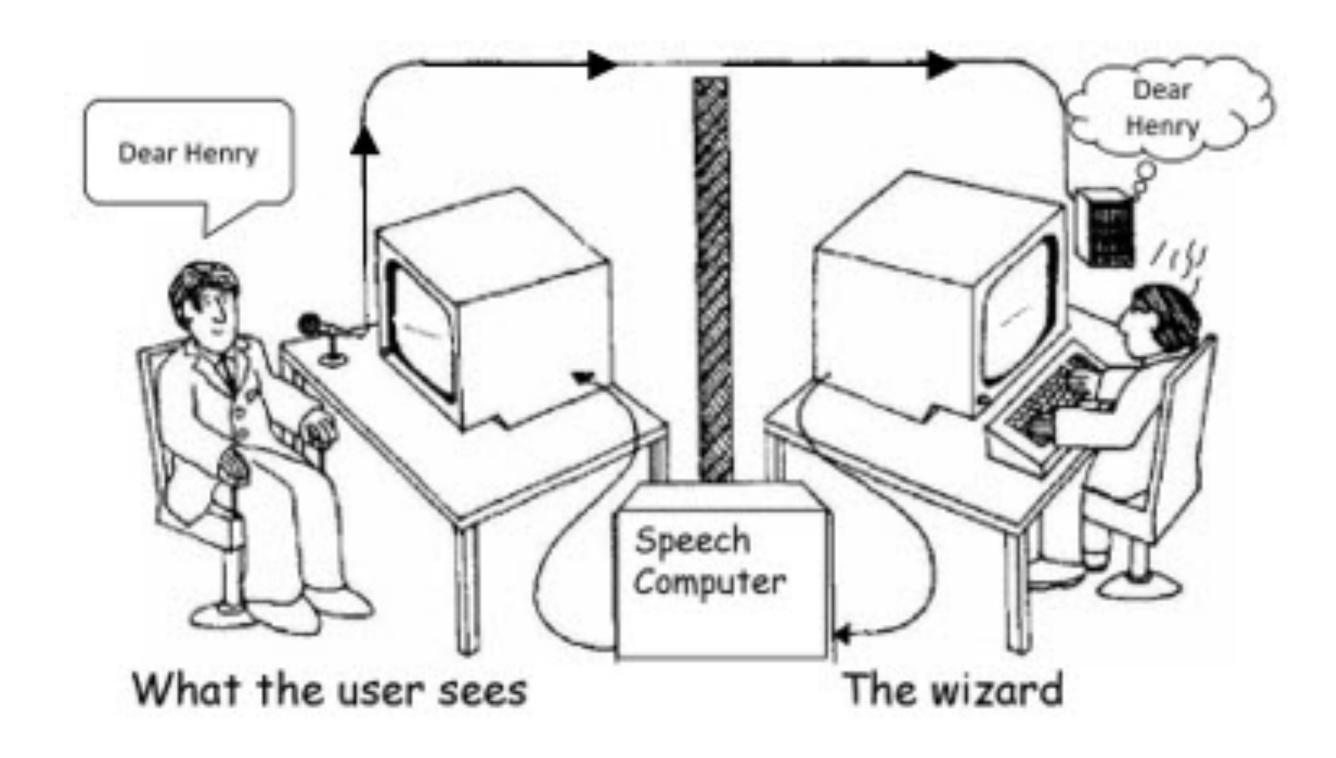

horizontal prototype (your WoZ prototype)

vertical prototype

The Wizard of Oz technique

• A setup where subjects interact with a computer system they believe to be autonomous, but the system is actually operated by an (unseen) human being

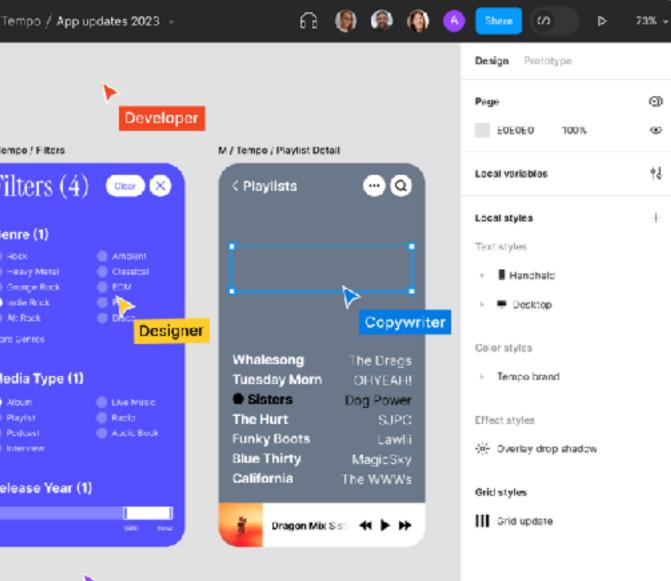

Wizard of Oz testing – The listening type writer IBM 1984

Your project timeline

- Today: get started on paper prototyping your main scenario
- First class after spring break: make & evaluate more scenario paper prototypes
- Week after spring break: use **Figma** to make a Wizard of Oz breadth prototype

Guidelines for "good" design

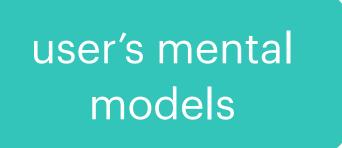

AKA you'll never look at common household appliances the same way

Conceptual model

designer's mental models

- As designers, we want to minimize the gap between a designer's mental model and the user's mental model
- the need for written instructions/documentation
- "Walk up and use" cases

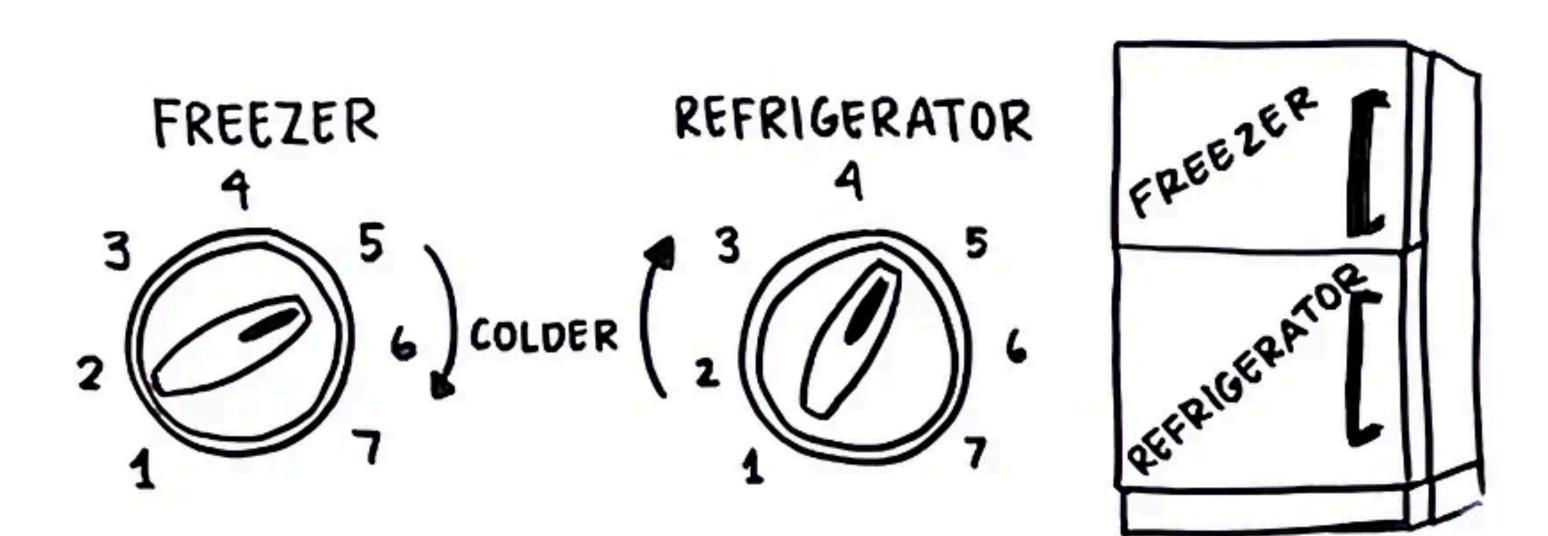

• That's the purpose of an *interface*: to communicate our design intent without

Conceptual model example

• In The Design of Everyday Things, Don Norman gives a fridge example. He his refrigerator colder too.

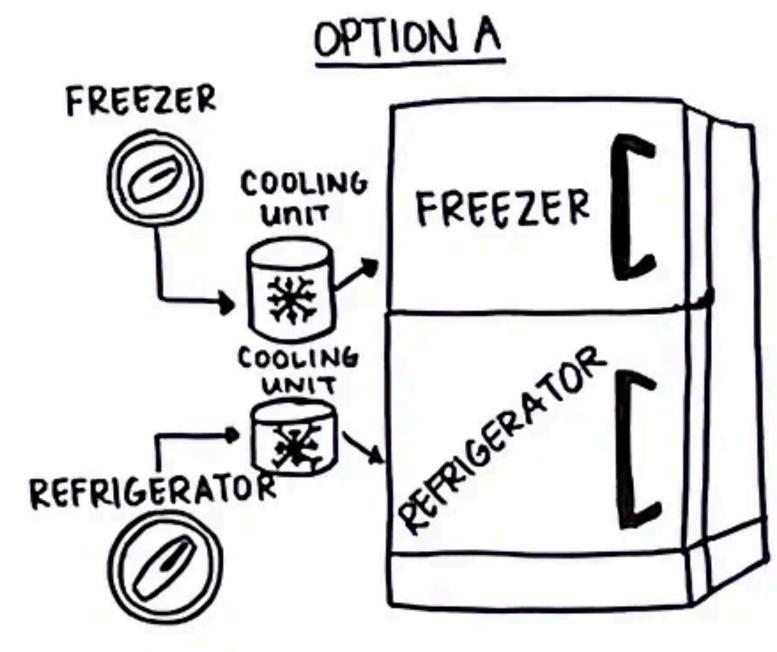

Drawings from <u>https://www.factoftheday1.com/p/march-14-mental-models-with-an-example</u>

wanted to make his freezer colder, so he turned the freezer dial. But it made

Conceptual model example

 In reality, the controls were shared: mental models.

HOW HE THOUGHT IT WORKED

Drawings from https://www.factoftheday1.com/p/march-14-mental-models-with-an-example

• In reality, the controls were shared: a difference in the designer's versus user's

HOW IT REALLY WORKS

Affordance

 "the term affordance refers to the p thing, primarily those fundamental thing could possibly be used."

"the term affordance refers to the perceived and actual properties of the

thing, primarily those fundamental properties that determine just how the

Scissors afford cutting

What are some clues?

- Holes for fingers to hold
- Sharp blades to cut things
- Screw to allow axial rotation

We call these **signifiers**.

"Natural" vs learned affordance

- Affordances can be cultural
- Obvious: glass is see through (inherent property)
- Learned
 - Knobs afford turning
 - Glass affords breaking
 - Buttons afford pushing

Turnability

See through

Breakability

Pushability

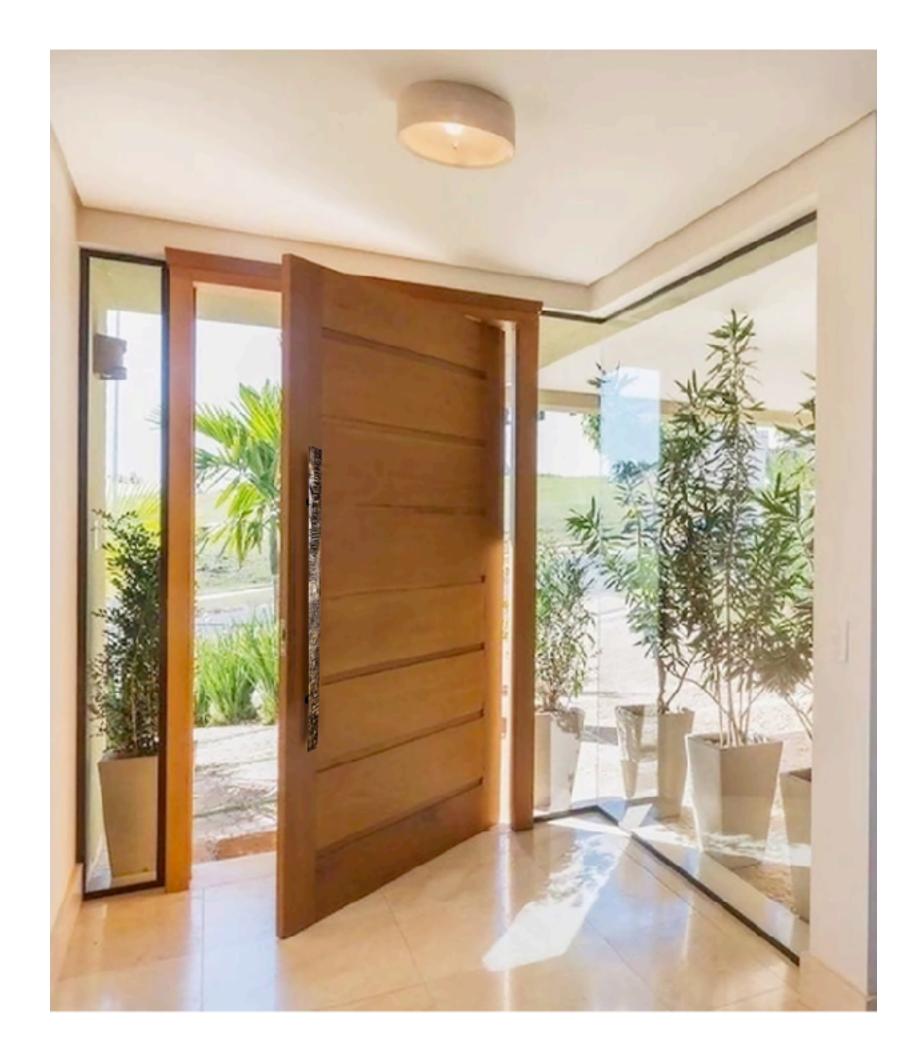

Infamous door handles

Better: push bars vs pull handles

Your turn

- Affordance contest!
- 90 seconds, brainstorm as many affordances (and the corresponding signifiers) as you can. Keep track!

Turn to the person next to you and pick an object one of you has on hand. In

- Sharp blades signify that scissors afford cutting
- Finger holes signify that scissors afford holding
- Screw signifies that scissors afford rotational movement
- Weight of the steel signifies that scissors afford being used as a blunt weapon

Skeumorphism

- resulting in naive conceptual models
- Skeumorphism is a kind of metaphor where digital GUIs (graphical user interfaces) were made to resemble analog equivalents

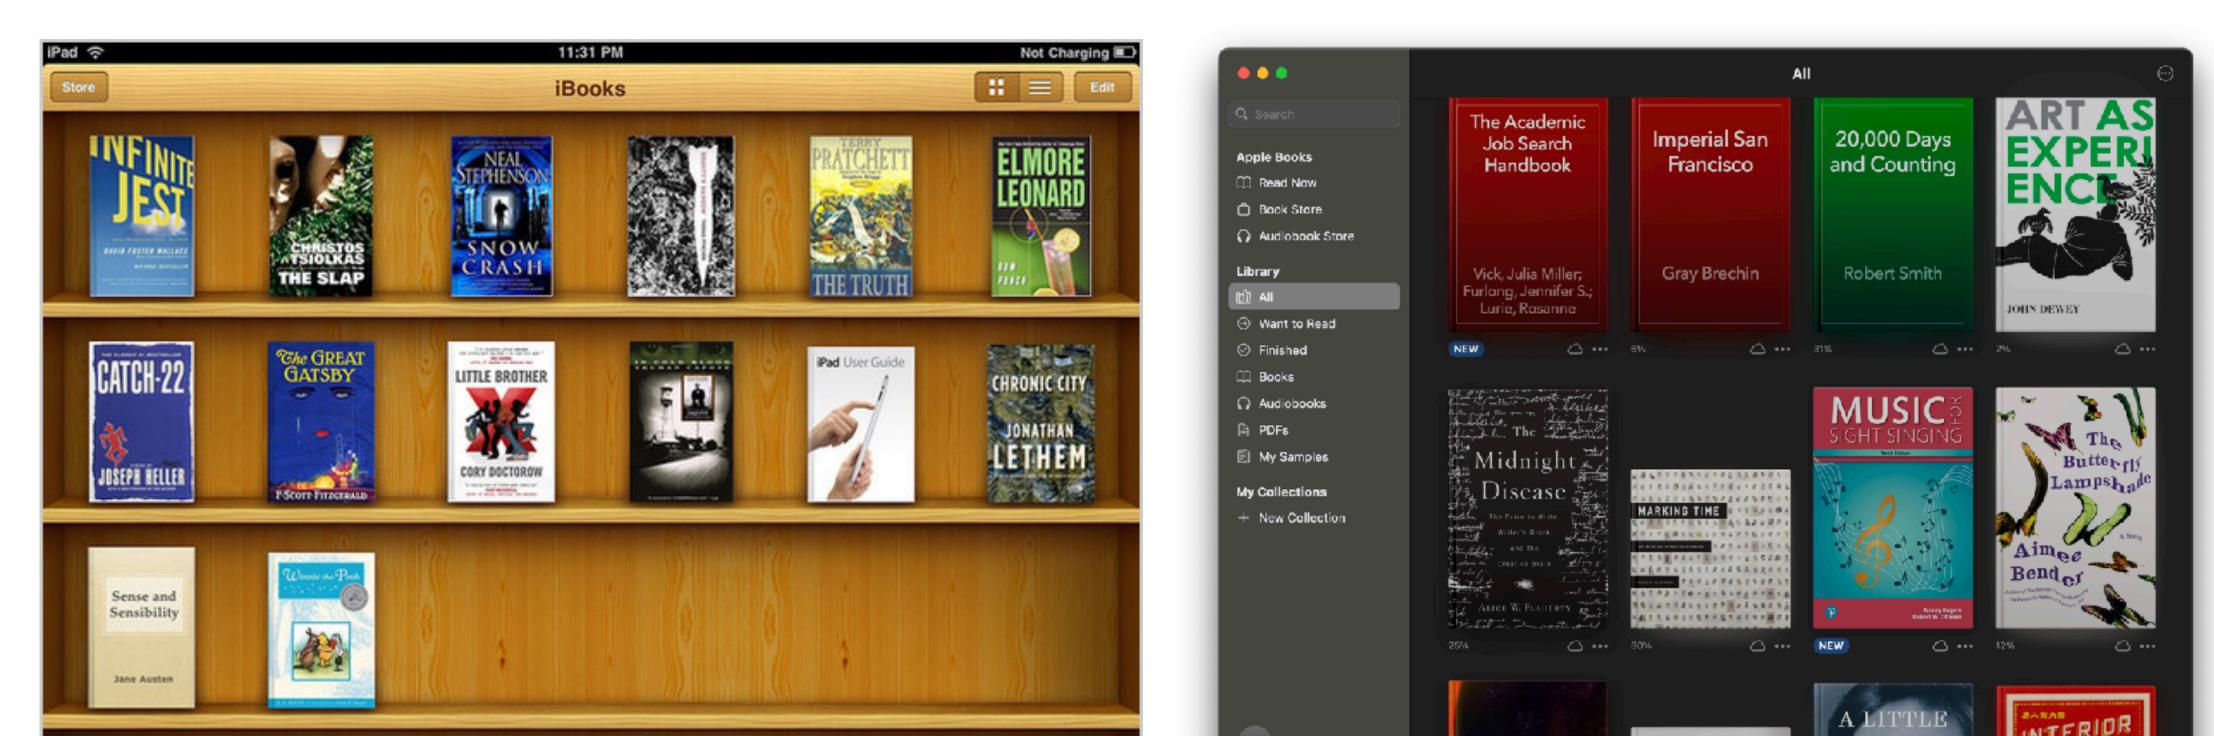

• Using metaphors is a design strategy to help leverage the familiar, but risks in

Skeumorphism

- Pros
- Reuse learned knowledge
- Repurpose conceptual models
- Clearly shows affordances

Cons

- Limits what users can do
- Implies capabilities that my not exist

3 Design Principles

1. Make controls visible

2. Make mappings clear

3. Provide feedback

Make controls visible

Poor visibility (how do you set an alarm?)

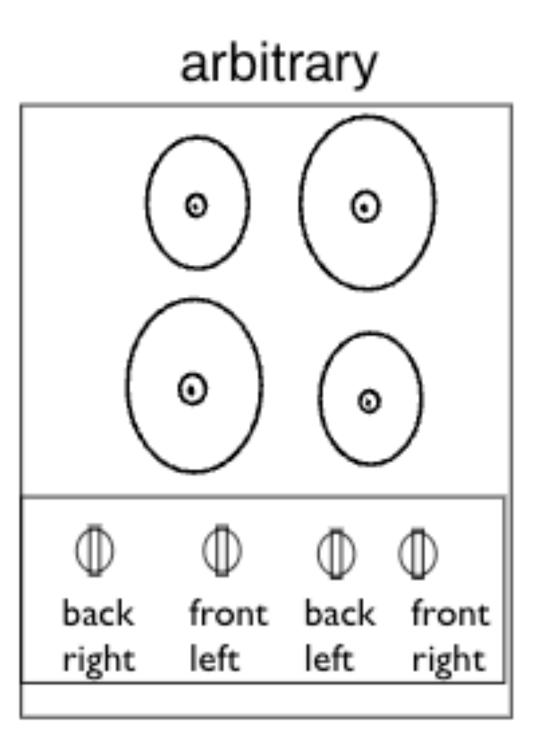

Too much visibility

Make mappings clear

Good mapping for car seat controls

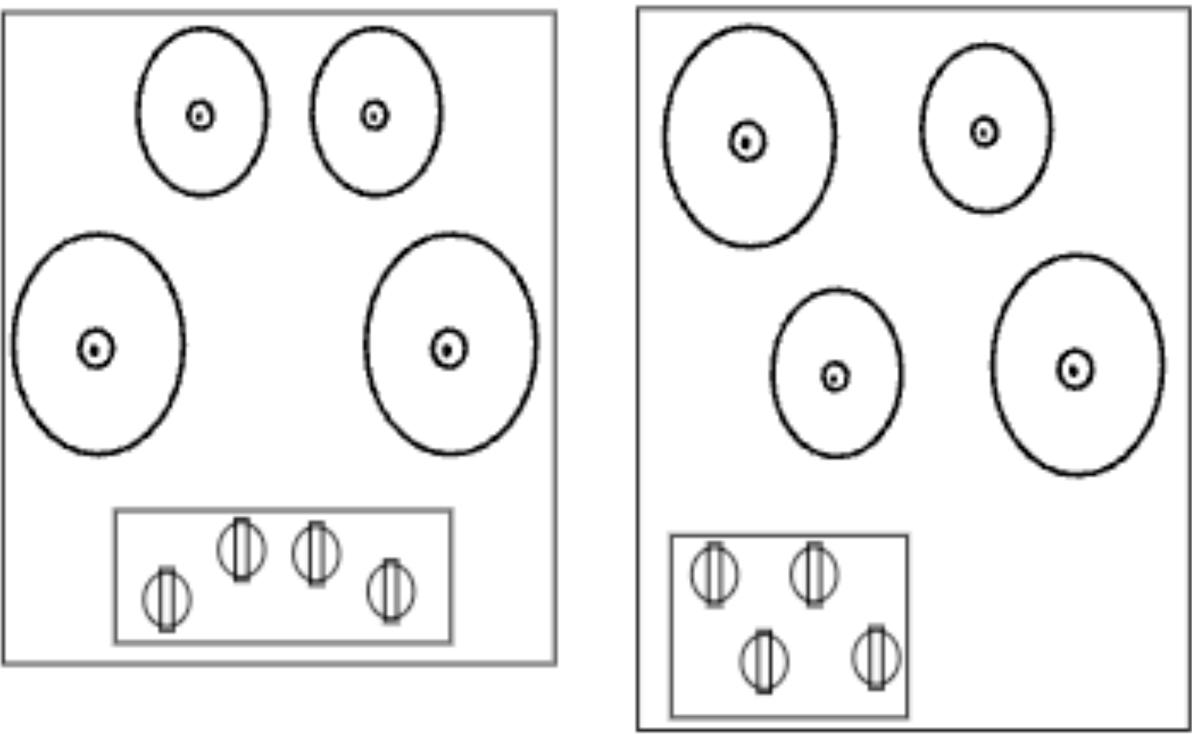

24 possibilities! Requires: visible labels memory

Bad mapping for stove top

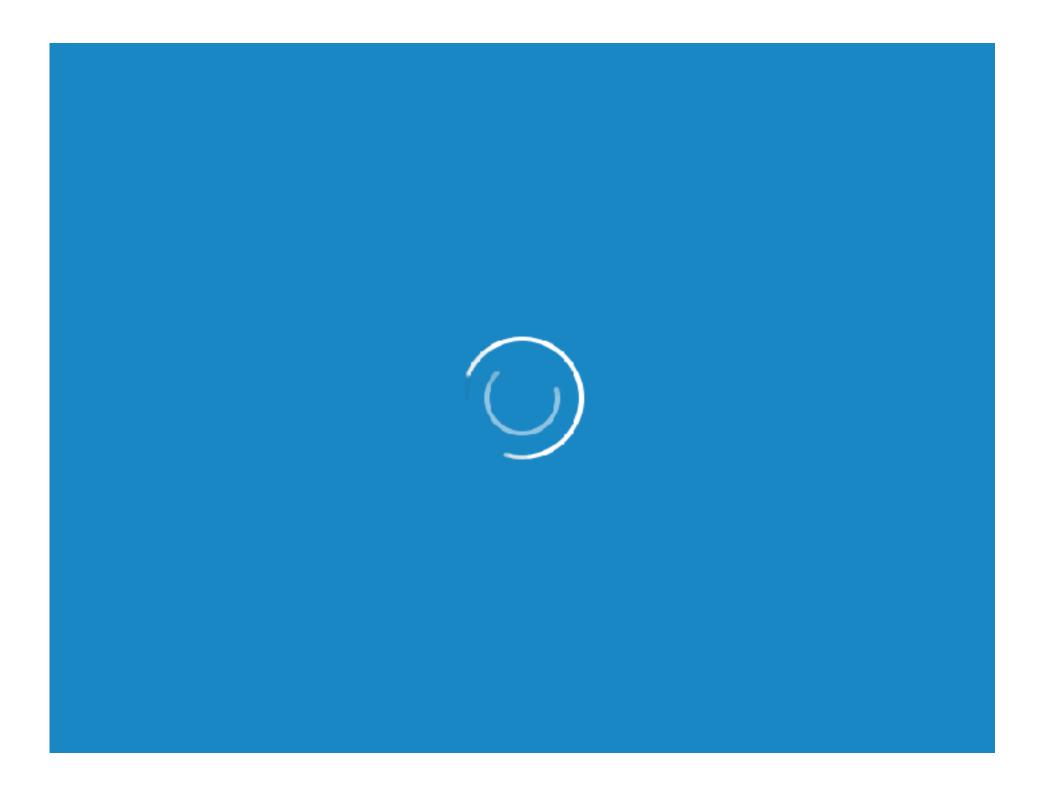

Make mappings clear

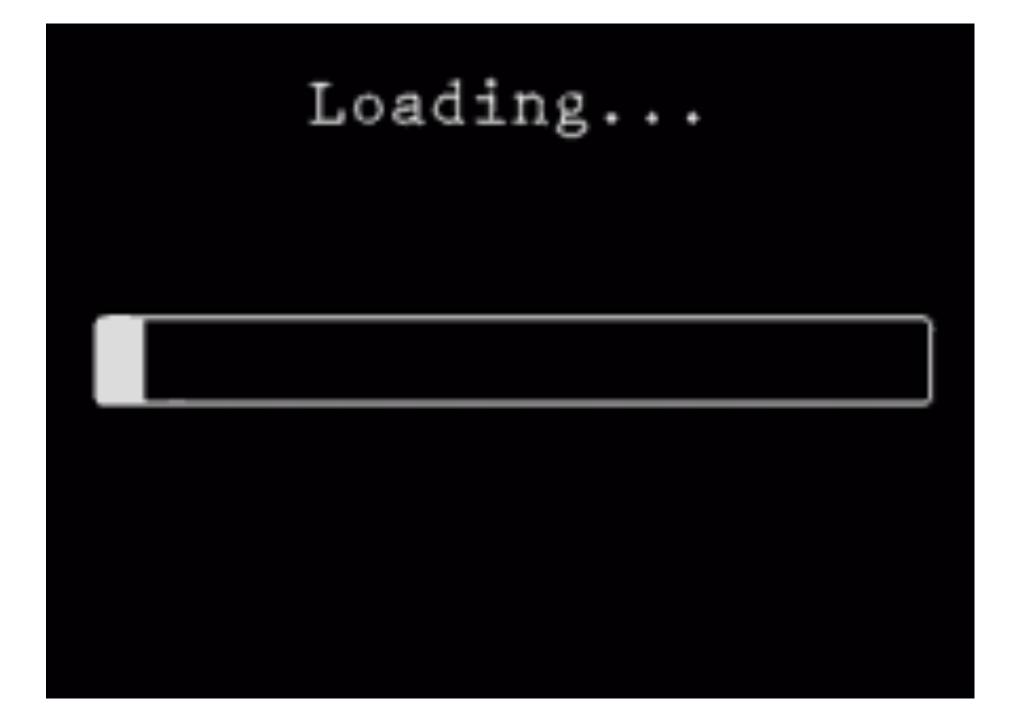

full mapping

Better: controls placed in the same orientation as burners

Provide feedback

Bad: when will it be done??

Better: some relative information

Summary

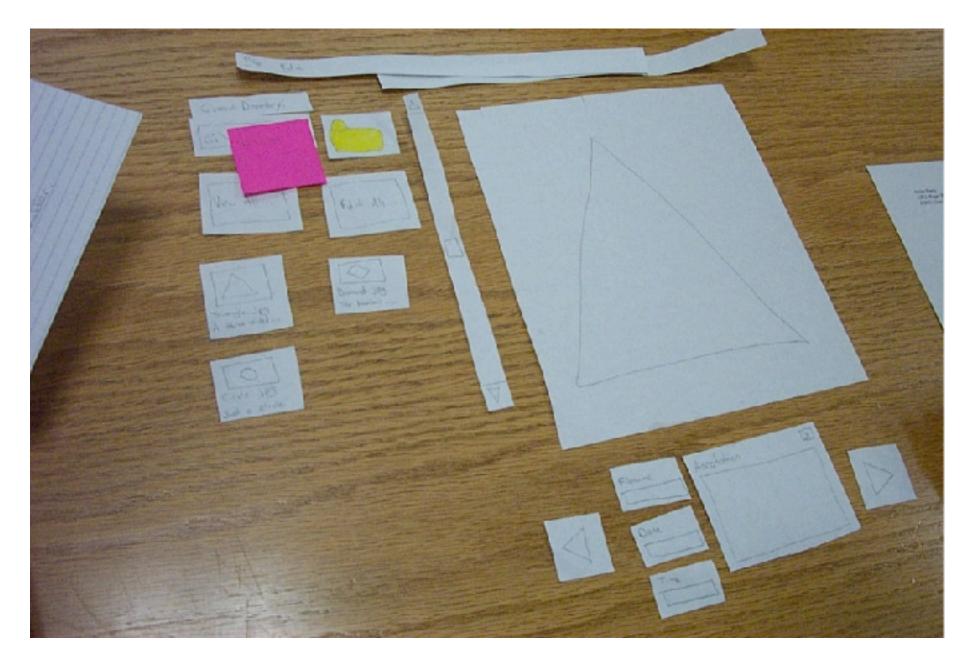

- Prototypes force you to make design decisions quickly and cheaply. "Fail fast, fail often" before you sink in engineering time
- Much of "good" design stems from matching your and the user's mental models. To do so,
 - Make affordances and controls visible but not over-exposed
 - Provide clear mappings between controls (inputs) and outputs
 - Provide clear and timely feedback in response to user input

Your first paper prototype

Paper is easier than code

- Making with paper is faster and cheaper than implementing with code
- Use post-its or cut out smaller sheets of paper to replace UI elements

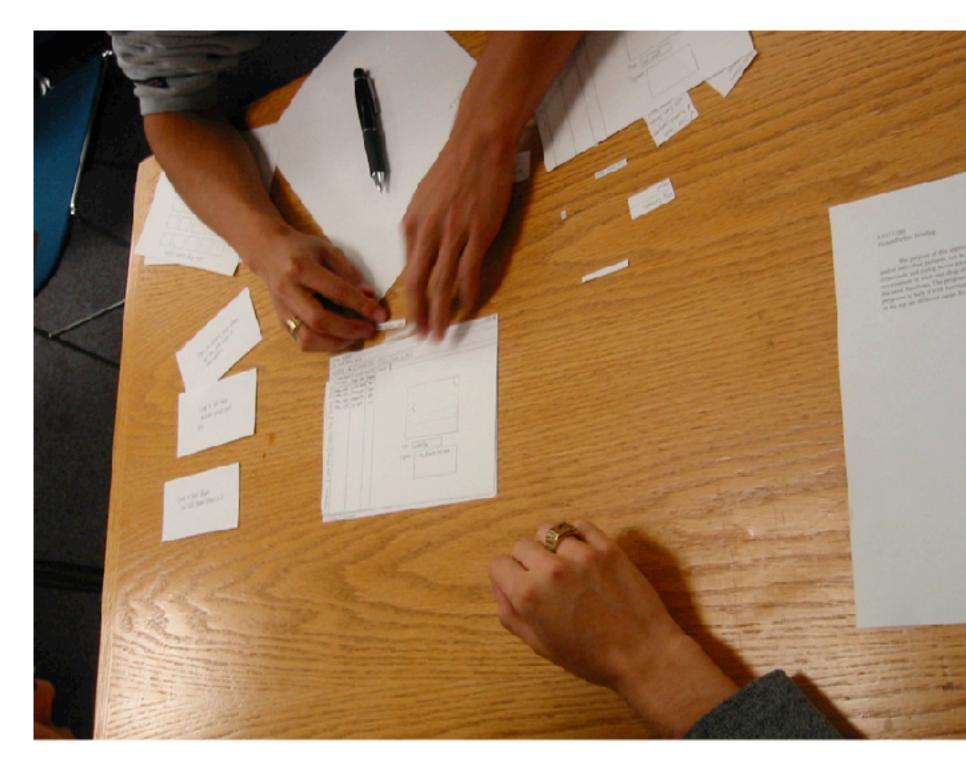

Other ways of interactivity

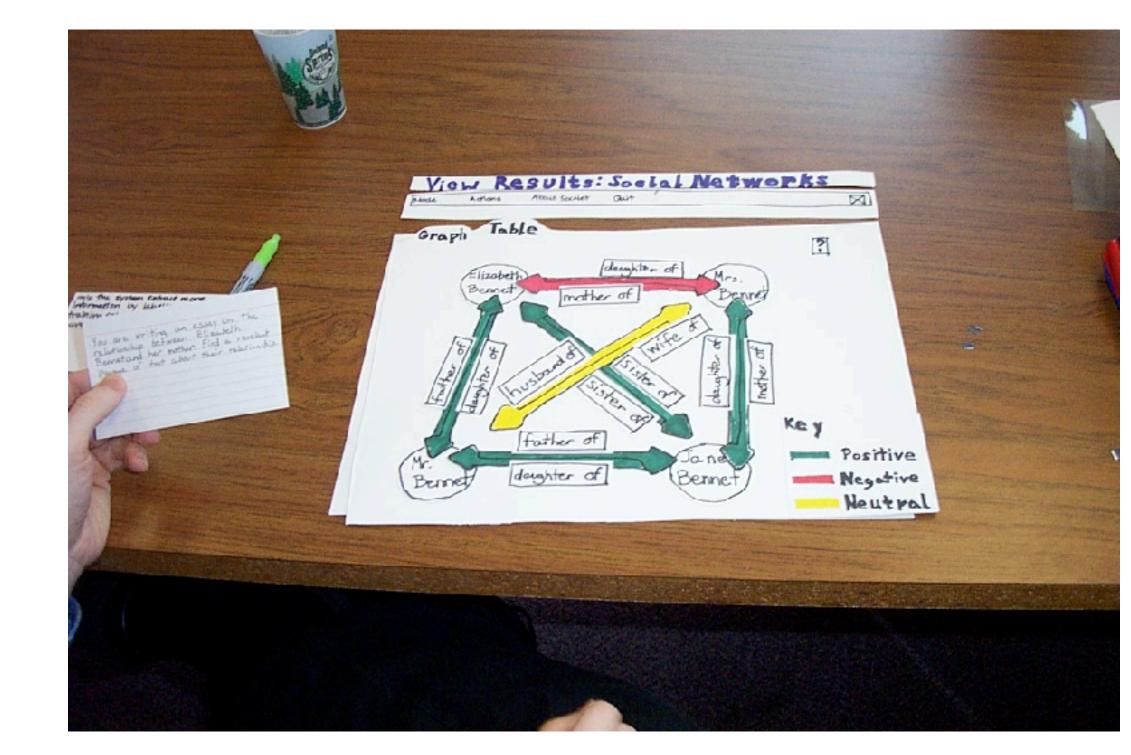

Make a "frame" (like a phone or laptop screen) and replace screen content inside

Size matters

- Bigger prototypes are easier to manipulate and switch out screens
- If you're making a web app, aim for a full 8.5x11 sheet of paper (a laptop screen size)
- Write big and dark: markers are better than pencil

Multiple alternatives generate better feedback

Summer Weekdays Create Program	Program	Summer on Vacation	Today:	Time :

(Jun 01, 2005) pm	Date Date	Time Temperature	Program Time /	Date Change Temp.

• When a design is presented with others, people tend to be more ready to design.

Tohidi, Buxton, Baecker, Sellen. "Getting the Right Design and the Design Right: Testing Many Is Better Than One." CHI 2006.

criticize and offer problems, which is exactly what you want in the early stages of

What can and can't you learn?

- **Functionality:** Does your tool do what it needs to do? Is it missing features?
- **Conceptual model:** Do users understand it?
- Navigation & task flow: Can users find their way around?
- **Terminology:** Do users understand symbols or how to interact with UI elements?
- **Screen content:** Are you displaying the right information at the right time?

• Can't learn...

Look & feel

Response time

 Exploration << deliberation: users don't explore as much with paper prototypes

Step 1: Pick your scenario

- 2 min: As a group, decide what the most important scenario for your tool is (what do users want to do, and how will your tool accomplish it?)
 - Go back to your design goals if you're struggling •

scenario (today)

horizontal prototype (your WoZ prototype)

vertical prototype

Step 2: Everyone make a paper prototype

- Everyone should make their own first stab at a wireframe to accomplish this task scenario (more ideas generates better feedback!)
 - What elements are on the screen? How does the user interact with them?
 (visible affordances)
 - What options are available to the user? What parameters are important?
 (mappings)
 - How does interacting with the elements change the UI? (feedback/flow)
 - How does the user know when the scenario is done? (feedback)
- Bring them to class on Thursday: we'll be testing them within your groups

Class 15 recap

- TODOs: •
 - Thurs
 - Bring your (finished) paper prototype to class!
 - Zipcrit from Ariel
 - Fri 11:59pm
 - any work over spring break)

• No exit ticket this week: anonymous written mid-semester feedback instead!

1 sketchnote (see Canvas for details), seminar from Angie & David

P2M2 - Intro due (Extensions until Sunday OK, I just didn't want to assign
