

What order would this variant visit the states?
def search(state):
if state.is_goal():
return state
else:
for $s$ in state.next_states():
result $=$ search(s)
if result != None: return result
return None

1, 2, 5

What order would this variant visit the states?
What order would this variant visit the states?

```
def search(state):
    if state.is_goal():
        return state
    else:
        for s in state.next_states():
            result = search(s)
            if result != None:
                return result
            return None
    1,2,5,3,6,9,7,8
    DFS! Where's the stack?
```

## N -queens problem

Place N queens on an N by N chess board such that none of the N queens are attacking any other queen.

Solution(s)?

## One last DFS variant

```
def search(state):
if state.is_goal():
    return state
    else:
        for s in state.next_states()
            result = search(s)
            if result != None:
        return None
```

def dfs(state):
if state.is_goal()
return [state]

| One last DFS variant |  |
| :---: | :---: |
| ```def search(state): if state.is_goal(): return state else: for s in state.next_states(): result = search(s) if result != None: return result return None``` | ```def dfs(state): if state.is_goal(): return [state] else: result = [] for s in state.next_states(): result += dfs(s) return result``` Returns ALL solutions found, not just one |

## N -queens problem

Place N queens on an N by N chess board such that none of the N queens are attacking any other queen.

## N -queens problem

Place N queens on an N by N chess board such that none of the N queens are attacking any other queen.

How do we solve this with search:

What is a state?

What is the start state?

What is the goal?

How do we transition from one state to the next?

add the start state to to_visit

## Repeat

- take a state off the to_visit list
$\square$ if it's the goal state is this a goal state?
we're done!
$\square$ if it's not the goal state What states can I get to from the current state? - Add all of the next states to the to _visit list

Any problem that we can define these three things can be plugged into the search algorithm!
