Consider the following relations. Is each one reflexive, symmetric, and/or transitive? If it’s all three and therefore an equivalence relation, describe the equivalence classes.

1. $S =$ all juniors and seniors currently enrolled at Pomona. $(x, y) \in R_1$ if they share a major.

2. $S = \mathbb{Z}$. $(x, y) \in R_2$ if $x = y$.

3. $S = \{1, 2, 3, 4, 5\}$. $R_3 = \{(1, 5), (2, 2), (2, 4), (4, 1), (4, 2)\}$.

Let $S$ be the set of all students currently enrolled at Pomona. Define an equivalence relation on $S$ that isn’t one of the ones discussed in lecture on Monday.

Consider the relation $R = \{(1, 5), (2, 2), (2, 4), (4, 1), (4, 2)\}$ on $\{1, 2, 3, 4, 5\}$. What is the reflexive closure? What is the symmetric closure? What is the transitive closure?
Given $p = 3$ and $q = 13$, what are:

- $n$
- $\phi(n)$
- $e$
- $d$
- public key:
- private key:

What do you get if you encrypt 10?
