- Problem 2 - Heaps
- Problem 3 - Tree traversals
- Problem 4 - Binary Trees
- Problem 5 - Binary Search Trees
- Problem 6 - Iterators
Problem 1 - Sorting

- In the next slide, you can find a table whose first row (last column 0) contains an array of 18 unsorted numbers between 1 and 50. The last row (last column 6) contains the numbers in sorted order. The other rows show the array in some intermediate state during one of these five sorting algorithms:
  - 1-Selection sort
  - 2-Insertion sort
  - 3-Mergesort
  - 4-Quicksort (no initial shuffling, one partition only)
  - 5-Heapsort

- Match each algorithm with the right row by writing its number (1-5) in the last column.

</table>
Problem 2 - Heaps

- Consider the following max-heap:

- Draw the heap after you insert key 13.

- Suppose you delete the maximum key from the original heap. Draw the heap after you delete 14.
Problem 3 - Tree Traversals

Circle the correct binary tree(s) that would produce both of the following traversals:

- Pre-order: C R B W O S T N Q
- In-order: B R W O C S N T Q
Problem 4 - Binary Trees

- You are extending the functionality of the BinaryTree class that represents binary trees with the goal of counting the number of leaves. Remember that BinaryTree has a pointer to a root Node and the inner class Node has two pointers, left and right to the root nodes that correspond to its left and right subtrees.

- You are given the following public method:

```java
public int sumLeafTree()
    return sumLeafTree(root);
}
```

- Please fill in the body of the following recursive method

```java
private int sumLeafTree(Node x){...}
```
Problem 5 - Binary Search Trees

You are extending the functionality of the BST class that represents binary search trees with the goal of counting the number of nodes whose keys fall within a given \([\text{low}, \ \text{high}]\) range. That is you want to count how many nodes have keys that are equal or larger than \(\text{low}\) and equal or smaller than \(\text{high}\). Remember that BST has a pointer to a root Node and the inner class Node has two pointers, left and left to the root nodes that correspond to its left and right subtrees and a Comparable Key key (please ignore the value).

You are given the following public method:

```java
public int countRange(Key low, Key high)
    return countRange(root, Key low, Key high);
}
```

Please fill in the body of the following recursive method

```java
private int countRange(Node x, Key low, Key high){...}
```
Problem 6 - Iterators

A programmer discovers that they frequently need only the odd numbers in an arraylist of integers. As a result, they decided to write a class \texttt{OddIterator} that implements the \texttt{Iterator} interface. Please help them implement the constructor and the \texttt{hasNext()} and \texttt{next()} methods so that they can retrieve the odd values, one at a time. For example, if the arraylist contains the elements \([7, 4, 1, 3, 0]\), the iterator should return the values 7, 1, and 3.

You are given the following public class:

```java
public class OddIterator implements Iterator<Integer> {
    // The array whose odd values are to be enumerated
    private ArrayList<Integer> myArrayList;
    // any other instance variables you might need
    // An iterator over the odd values of myArrayList
    public OddIterator(ArrayList<Integer> myArrayList){...}
    public boolean hasNext(){...}
    public Integer next(){...}
}
```

Solution to Problem 2 - Heaps

- Insert key 13:

- Delete max-key (14):
Solution to Problem 3 - Tree traversals

- Pre-order: C R B W O S T N Q
- In-order: B R W O C S N T Q
PRACTICE PROBLEMS FOR MIDTERM 2

Solution to Problem 4 - Binary Trees

```java
private int sumLeafTree(Node x){
    if (x == null){
        return 0;
    }
    else if (x.left == null && x.right == null){
        return 1;
    }
    else{
        return sumLeafTree(x.left) + sumLeafTree(x.right);
    }
}
```
Solution to Problem 5 - Binary Search Trees

private int countRange(Node x, Key low, Key high){
    if (x == null){
        return 0;
    } else if (x.key.compareTo(low)<0){
        return countRange(x.right, low, high);
    } else if (x.key.compareTo(low) >=0 && x.key.compareTo(high)<=0){
        return 1 + countRange(x.left, low, high) + countRange(x.right, low, high);
    } else{
        return countRange(x.left, low, high);
    }
}
// SOLUTION TO 6 THAT DOESN'T REQUIRE hasNext BE CALLED BEFORE
// next()

public class OddIterator implements Iterator<Integer> {
    private ArrayList<Integer> list;
    private Integer nextVal = null;
    private int counter = 0;

    public OddIterator(ArrayList<Integer> list) {
        this.list = list;
        nextVal = loadNext();
    }

    // Search for the next odd value
    private Integer loadNext() {
        nextVal = null;

        while (nextVal == null && counter < list.size()) {
            if (list.get(counter) % 2 == 1) {
                nextVal = list.get(counter);
            }
            counter++;
        }

        return nextVal;
    }

    public boolean hasNext() {
        return nextVal != null;
    }

    public Integer next() {
        Integer answer = nextVal;
        nextVal = loadNext();
        return answer;
    }
}
Solution to Problem 6 - Iterators

```java
public class OddIterator implements Iterator<Integer> {

    private ArrayList<Integer> myArrayList;
    int counter;

    public OddIterator(ArrayList<Integer> myArrayList){
        this.myArrayList = myArrayList;
        counter = 0;
    }

    //runs in O(n) time
    public boolean hasNext(){
        for (int i=counter; i<myArrayList.size(); i++){
            if(myArrayList.get(i)%2 == 1){
                counter = i;
                return true;
            }
        }
        return false;
    }

    //runs in O(1) time
    public Integer next(){
        return myArrayList.get(counter++);
    }
}
```
GOOD LUCK! YOU CAN DO THIS!
