- Performance
Height of 2-3 search trees

- **Worst case**: $\log n$ (all 2-nodes).
- **Best case**: $\log_3 n = 0.631 \log n$ (all 3-nodes)
  - That means that storing a million nodes will lead to a tree with height between 12 and 20, and storing a billion nodes to a tree with height between 18 and 30 (not bad!).
- Search and insert are $O(\log n)$!
- But implementation is a pain and the overhead incurred could make the algorithms slower than standard BST search and insert.
- We did provide insurance against a worst case but we would prefer the overhead cost for that insurance to be low. Stay tuned! We will see a much easier way.

Lecture 20: Left-leaning Red-Black Trees

- Introduction
- Elementary red-black BST operations
- Insertion
- Mathematical analysis
- Historical context

Some slides adopted from Algorithms 4th Edition or COS226
Left-leaning red-black BSTs correspond 1-1 with 2-3 trees

- Represent 2-3 tree as a BST
  - Start with standard BSTs which are made up of 2-nodes.
- Use “internal” left-leaning links as “glue” for 3-nodes
  - Add extra information to encode 3-nodes. We will introduce two types of links.
- Red links: bind together two 2-nodes to represent a 3-node.
  - Specifically, 3-nodes are represented as two 2-nodes connected by a single red link that leans left (one of the 2-nodes is the left child of the other).
- Black links: bind together the 2-3 tree.
- Advantage: Can use BST code with minimal modification.
Left-leaning red-black BSTs correspond 1-1 with 2-3 trees

1-1 correspondence between red-black BSTs and 2-3 trees
Definition

- A left-leaning red-black tree is a BST such that:
  - No node has two red links connected to it.
    - Red links “glue” 2 2-nodes to make 1 3-node
  - Red link leans left.
  - Every path from root to leaves has the same number of black links (perfect black balance). Red links are “internal”.

![red-black BST](image)
Search

- Exactly the same as for elementary BSTs (we ignore the color).
- But runs faster because of better balance.

```java
public Value get(Key key) {
    if (key == null) throw new IllegalArgumentException("argument to get() is null");
    return get(root, key);
}

// value associated with the given key in subtree rooted at x; null if no such key
private Value get(Node x, Key key) {
    while (x != null) {
        int cmp = key.compareTo(x.key);
        if (cmp < 0) x = x.left;
        else if (cmp > 0) x = x.right;
        else return x.val;
    }
    return null;
}
```

- Operations such as floor, iteration, rank, selection are also identical.
Representation

- There is no representation of the links in BST
  - Each node is pointed to by one node, its parent.
  - We can use this to encode the color of the links in nodes.
  - True if the link from the parent is red and false if it is black. Null links are black.

```java
private static final boolean RED = true;
private static final boolean BLACK = false;

private Node root; // root of the BST

// BST helper node data type
private class Node {
    private Key key; // key
    private Value val; // associated data
    private Node left, right; // links to left and right subtrees
    private boolean color; // color of parent link
    private int size; // subtree count

    private boolean isRed(Node x) {
        if (x == null) return false;
        return x.color == RED;
    }
```
Story so far

- BSTs can get imbalanced and long.
- 2-3 trees are balanced but cumbersome to code.
- Imagine 3-nodes held together by internal glue links shown in red.
- Draw links by giving them red or black color.
- Represent them in memory by storing the color of the link coming from the parent as the color of the child node.
Which of the following are legal LLRB trees?

A left-leaning red-black tree is a BST such that:

- No node has two red links connected to it.
  - Red links connect 2 2-nodes to make 1 3-node

- Red link leans left.

- Every path from root to leaves has the same number of black links (perfect black balance).
Answer

- Which of the following are legal LLRB trees?
  - iii and iv
    - i is not balanced and ii is also not in symmetrical order

![Diagram showing LLRB trees examples](image-url)
Lecture 28-29: Left-leaning Red-Black Trees

- Introduction
- Elementary red-black BST operations
- Insertion
- Mathematical analysis
- Historical context
**Left rotation**: Orient a (temporarily) right-leaning red link to lean left

Node `rotateLeft(Node h)`

```java
Node x = h.right;
h.right = x.left;
x.left = h;
x.color = h.color;
h.color = RED;
x.N = h.N;
h.N = 1 + size(h.left) + size(h.right);
return x;
```
Right rotation: Orient a left-leaning red link to a (temporarily) lean right
**Color flip:** Recolor to split a (temporary) 4-node
Lecture 28-29: Left-leaning Red-Black Trees

- Introduction
- Elementary red-black BST operations
- Insertion
- Mathematical analysis
- Historical context
Basic strategy: Maintain 1-1 correspondence with 2-3 trees

- During internal operations, maintain:
  - symmetric order.
  - perfect black balance.

- But we might violate color invariants. For example:
  - Right-leaning red link.
  - Two red children (temporary 4-node).
  - Left-left red (temporary 4-node).
  - Left-right red (temporary 4-node).

- To restore color invariant we will be performing rotations and color flips.
Insertion into a LLRB

- Do standard BST insertion and **color the new link red**.
- Repeat until color invariants restored:
  - Both children red? Flip colors.
  - Right link red? Rotate left.
  - Two left reds in a row? Rotate right.
Red-black BST construction demo

Red-black BST
Implementation

- Only three cases:
  - Right child red; left child black: rotate left.
  - Left child red; left-left grandchild red: rotate right.
  - Both children red: flip colors.

```java
private Node put(Node h, Key key, Value val) {
    int cmp = key.compareTo(h.key);
    if (cmp < 0) h.left = put(h.left, key, val);
    else if (cmp > 0) h.right = put(h.right, key, val);
    else h.val = val;

    // fix-up any right-leaning links
    if (isRed(h.right) && !isRed(h.left)) h = rotateLeft(h);  // left rotate
    if (isRed(h.left) && isRed(h.left.left)) h = rotateRight(h);  // right rotate
    if (isRed(h.left) && isRed(h.right)) flipColors(h);
    h.size = size(h.left) + size(h.right) + 1;

    return h;
}
```
Visualization of insertion into a LLRB tree

- 255 insertions in ascending order.
Visualization of insertion into a LLRB tree

- 255 insertions in descending order.
Visualization of insertion into a LLRB tree

- 255 insertions in random order.

- Historical context
Balance in LLRB trees

- Height of LLRB trees is $\leq 2 \log n$ in the worst case. Can you think of the worst case?
- Worst case is a 2-3 tree that is all 2-nodes except that the left-most path is made up of 3-nodes.
- All ordered operations (min, max, floor, ceiling) etc. are also $O(\log n)$.

Lecture 28-29: Left-leaning Red-Black Trees

- Introduction
- Elementary red-black BST operations
- Insertion
- Mathematical analysis
- Historical context
Red-black trees

- Why red-black? Xerox PARC had a laser printer and red and black had the best contrast...

- Left-leaning red-black trees [Sedgewick, 2008]
  - Inspired by difficulties in proper implementation of RB BSTs.

- RB BSTs have been involved in lawsuit because of improper implementation.
Balanced trees in the wild

- Red-black trees are widely used as system symbol tables.
  - e.g., Java: `java.util.TreeMap` and `java.util.TreeSet`.
- Other balanced BSTs: AVL, splay, randomized.
- 2-3 search trees are a subset of b-trees.
  - See book for more.
- B-trees are widely used for file systems and databases.

Practice Problems

- End of lecture slides
- Go over in midterm review during lab
TODAY’S LECTURE IN A NUTSHELL

Sorting

- Selection sort
- Insertion sort
- Merge sort
- Quick sort
- Heap sort
Sorting

- Given an array of n items, sort them in non-descending order based on a comparable key.
- Cost model counts comparisons (calls to \texttt{less()} and exchanges (calls to \texttt{exch()})) (or array accesses).
- Not in place: If linear extra memory is required.
- Stable: If duplicate elements stay in the same order that they appear in the input.
- Practice: \url{https://visualgo.net/en/sorting} (minus quick sort).
Dictionaries

- Binary search trees
  - Search
  - Insertion
  - Deletion
- 2-3 search trees
- Left-leaning Red Black search trees
TODAY’S LECTURE IN A NUTSHELL

Dictionaries

- Binary search trees
- 2-3 search trees
2-3 search trees

- Balanced (every path from root to leaf has same length) search tree that follow the symmetric order. Contain 2 nodes (one key and two children) or 3 nodes (two keys and three children).

- Search and insertion of keys (and values) is $O(\log n)$.

- A pain to implement.

- Practice: [https://www.cs.usfca.edu/~galles/visualization/BTree.html](https://www.cs.usfca.edu/~galles/visualization/BTree.html) (max-degree 3).
2–3 tree demo: construction

insert R
Misc

- Comparable/Comparator Interfaces
- Iterable/Iterator Interfaces
- BT Traversals
Comparable Interface

- Interface with a single method that we need to implement:
  
  ```java
  public int compareTo(T that)
  ```

- Implement it so that `v.compareTo(w)`:
  - Returns $>0$ if $v$ is greater than $w$.
  - Returns $<0$ if $v$ is smaller than $w$.
  - Returns $0$ if $v$ is equal to $w$.

- Corresponds to natural ordering.
Comparator Interface

- Sometimes the natural ordering is not the type of ordering we want.
- Comparator is an interface which allows us to dictate what kind of ordering we want by implementing the method:
  
  ```java
  public int compare(T this, T that)
  ```

- Implement it so that `compare(v, w)`:  
  - Returns >0 if `v` is greater than `w`.
  - Returns <0 if `v` is smaller than `w`.
  - Returns 0 if `v` is equal to `w`.

- ```java
  public static Comparator<ClassName> reverseComparator(){
    return (ClassName a, ClassName b)->{return -a.compareTo(b)};
  }
  ```
Misc

- Comparable/Comparator Interfaces
- Iterable/Iterator Interfaces
- BT Traversals
Iterable<T> Interface

- Interface with a single method that we need to implement: 
  Iterator<T> iterator()

- Class becomes iterable, that is it can be traversed with a for-each loop.

```
for (String student: students){
   System.out.println(student);
}
```
Iterator\<T\> Interface

- Interface with two methods that we need to implement: \texttt{boolean hasNext()} and \texttt{T next()}.

- \texttt{hasNext()} checks whether there is any element we have not seen yet.

- \texttt{next()} returns the next available element.

- Always check if there are any available elements before returning the next one.

- Typically a comparable class, has an inner class that implements \texttt{Iterator}. Outer class’s \texttt{iterator} method returns an instance of inner class.

- Can also be implemented in a standalone class where collection to iterate over is passed in the constructor.
Misc

- Comparable/Comparator Interfaces
- Iterable/Iterator Interfaces
- BT Traversals
BT traversals

- Pre-order: mark root visited, left subtree, right subtree.
- In-order: left subtree, mark root visited, right subtree.
- Post-order: left subtree, right subtree, mark root visited.
- Level-order: start at root, mark each node as visited level by level, from left to right.
Practice Problems

- Problem 1 - Sorting
- Problem 2 - Heaps
- Problem 3 - Tree traversals
- Problem 4 - Binary Trees
- Problem 5 - Binary Search Trees
- Problem 6 - Iterators
Problem 1 - Sorting

- In the next slide, you can find a table whose first row (last column 0) contains an array of 18 unsorted numbers between 1 and 50. The last row (last column 6) contains the numbers in sorted order. The other rows show the array in some intermediate state during one of these five sorting algorithms:
  - 1-Selection sort
  - 2-Insertion sort
  - 3-Mergesort
  - 4-Quicksort (no initial shuffling, one partition only)
  - 5-Heapsort

- Match each algorithm with the right row by writing its number (1-5) in the last column.
Problem 1 - Sorting

12 11 35 46 20 43 42 47 44 32 16 10 40 18 41 21 28 15 0
11 12 20 35 42 43 46 47 44 32 16 10 40 18 41 21 28 15
10 11 12 46 20 43 42 47 44 32 16 35 40 18 41 21 28 15
10 11 12 15 16 43 42 47 44 32 20 35 40 18 41 21 28 46
43 32 42 28 20 40 41 21 15 11 16 10 35 18 12 44 46 47
11 12 20 35 46 43 42 47 44 32 16 10 40 18 41 21 28 15
10 11 12 15 16 18 20 21 28 32 35 40 41 42 43 44 46 47 6
Problem 2 - Heaps

- Consider the following max-heap:

- Draw the heap after you insert key 13.

- Suppose you delete the maximum key from the original heap. Draw the heap after you delete 14.
Problem 3 - Tree Traversals

- Circle the correct binary tree(s) that would produce both of the following traversals:
  - Pre-order: C R B W O S T N Q
  - In-order: B R W O C S N T Q
Problem 4 - Binary Trees

- You are extending the functionality of the BinaryTree class that represents binary trees with the goal of counting the number of leaves. Remember that BinaryTree has a pointer to a root Node and the inner class Node has two pointers, left and right to the root nodes that correspond to its left and right subtrees.

- You are given the following public method:

```java
public int sumLeafTree()
    return sumLeafTree(root);
}
```

- Please fill in the body of the following recursive method

```java
private int sumLeafTree(Node x){...}
```
Problem 5 - Binary Search Trees

- You are extending the functionality of the BST class that represents binary search trees with the goal of counting the number of nodes whose keys fall within a given \([\text{low}, \text{high}]\) range. That is you want to count how many nodes have keys that are equal or larger than \(\text{low}\) and equal or smaller than \(\text{high}\). Remember that BST has a pointer to a root Node and the inner class Node has two pointers, left and right to the root nodes that correspond to its left and right subtrees and a Comparable Key key (please ignore the value).

- You are given the following public method:

  ```java
  public int countRange(Key low, Key high)
  {
      return countRange(root, Key low, Key high);
  }
  ```

- Please fill in the body of the following recursive method

  ```java
  private int countRange(Node x, Key low, Key high){...}
  ```
Problem 6 - Iterators

A programmer discovers that they frequently need only the odd numbers in an arraylist of integers. As a result, they decided to write a class OddIterator that implements the Iterator interface. Please help them implement the constructor and the hasNext() and next() methods so that they can retrieve the odd values, one at a time. For example, if the arraylist contains the elements [7, 4, 1, 3, 0], the iterator should return the values 7, 1, and 3.

You are given the following public class:

```java
public class OddIterator implements Iterator<Integer> {
    // The array whose odd values are to be enumerated
    private ArrayList<Integer> myArrayList;

    // Any other instance variables you might need

    // An iterator over the odd values of myArrayList
    public OddIterator(ArrayList<Integer> myArrayList){
    
    // Runs in O(n) time
    public boolean hasNext(){
    
    // Runs in O(1) time
    public Integer next(){
    }
}
```
